# Hermite Interpolation Error

**Theorem:** Suppose  $x_0, x_1, \dots, x_n$  are distinct numbers in the interval  $[a, b]$  and  $f \in C^{2n+2}[a, b]$ . Then, for each  $x \in [a, b]$ , a number  $\xi(x)$  between  $x_0, x_1, \dots, x_n$  (hence  $\in (a, b)$ ) exists with

$$f(x) = H(x) + \frac{f^{(2n+2)}(\xi(x))}{(2n+2)!} (x - x_0)^2 (x - x_1)^2 \cdots (x - x_n)^2,$$

where  $H(x)$  is the interpolating polynomial.

## Hermite Interpolation Error: Proof

If  $x = x_0, x_1, \dots, x_n$ , then error = 0 and theorem is true. Now let  $x$  be not equal to any node. Define function  $g$  for  $t \in [a, b]$

$$\begin{aligned} g(t) &\stackrel{\text{def}}{=} (f(t) - H(t)) - (f(x) - H(x)) \frac{(t - x_0)^2(t - x_1)^2 \cdots (t - x_n)^2}{(x - x_0)^2(x - x_1)^2 \cdots (x - x_n)^2} \\ &= (f(t) - H(t)) - (f(x) - H(x)) \prod_{j=0}^n \frac{(t - x_j)^2}{(x - x_j)^2} \in C^{2n+2}[a, b]. \end{aligned}$$

Then  $g(t)$  vanishes at  $n + 2$  distinct points:

$$g(x) = 0, \quad g(x_k) = 0, \quad \text{for } k = 0, 1, \dots, n.$$

and  $g'(t)$  vanishes at  $n + 1$  distinct points:

$$g'(x_k) = 0, \quad \text{for } k = 0, 1, \dots, n.$$

There must be a  $\xi$  between  $x$  and nodal points such that

$$g^{(2n+2)}(\xi) = 0.$$

# Hermite Interpolation Error: Proof

Since

$$\begin{aligned}g^{(2n+2)}(\xi) &= (f(t) - H(t))^{(2n+2)}|_{t=\xi} - (f(x) - H(x))\left(\prod_{j=0}^n \frac{(t - x_j)^2}{(x - x_j)^2}\right)^{(2n+2)}|_{\xi} \\ &= f^{(2n+2)}(\xi) - (f(x) - H(x)) \frac{(2n+2)!}{\prod_{j=0}^n (x - x_j)^2} \\ &= 0\end{aligned}$$

Therefore

$$f(x) = H(x) + \frac{f^{(2n+2)}(\xi(x))}{(2n+2)!} (x - x_0)^2 (x - x_1)^2 \cdots (x - x_n)^2,$$

$$(x_0, f(x_0)), (x_1, f(x_1)), \dots, (x_n, f(x_n)),$$

# The Splines Equations (I)

For  $x \in [x_j, x_{j+1}]$ ,  $j = 0, 1, \dots, n-1$ ,

$$S(x) = S_j(x) \stackrel{\text{def}}{=} a_j + b_j(x - x_j) + c_j(x - x_j)^2 + d_j(x - x_j)^3.$$

► for  $j = 0, 1, \dots, n-1$ ,

$$a_j = S_j(x_j) = f(x_j).$$

► let  $h_j = x_{j+1} - x_j$ , for  $j = 0, 1, \dots, n-1$ ,

$$a_{j+1} = S_{j+1}(x_{j+1}) = S_j(x_{j+1}) = a_j + b_j h_j + c_j h_j^2 + d_j h_j^3$$

$$b_j + c_j h_j + d_j h_j^2 = \frac{a_{j+1} - a_j}{h_j}, \quad j = 0, 1, \dots, n-1.$$

This ensures  $S(x) \in C[x_0, x_n]$ .

## The Splines Equations (II)

For  $x \in [x_j, x_{j+1}]$ ,  $j = 0, 1, \dots, n-1$ ,

$$S_j(x) = a_j + b_j(x - x_j) + c_j(x - x_j)^2 + d_j(x - x_j)^3$$

$$S'_j(x) = b_j + 2c_j(x - x_j) + 3d_j(x - x_j)^2$$

► Define  $b_n = S'_{n-1}(x_n)$ ; for  $j = 0, \dots, n-1$ ,

$$b_{j+1} = S'_{j+1}(x_{j+1}) = S'_j(x_{j+1}) = b_j + 2c_j h_j + 3d_j h_j^2.$$

This ensures  $S'(x) \in C[x_0, x_n]$ .

## The Splines Equations (III)

For  $x \in [x_j, x_{j+1}]$ ,  $j = 0, 1, \dots, n-1$ ,

$$\begin{aligned}S_j(x) &= a_j + b_j(x - x_j) + c_j(x - x_j)^2 + d_j(x - x_j)^3 \\S_j''(x) &= 2c_j + 6d_j(x - x_j)\end{aligned}$$

- ▶ Define  $c_n = S''_{n-1}(x_n)/2$ ; for  $j = 0, \dots, n-1$ ,

$$2c_{j+1} = S''_{j+1}(x_{j+1}) = S_j''(x_{j+1}) = 2c_j + 6d_j h_j.$$

This ensures  $S''(x) \in C[x_0, x_n]$ .

## The Splines Equations (IV)

For  $j = 0, \dots, n - 1$ ,

$$2c_{j+1} = 2c_j + 6d_j h_j, \quad \text{so} \quad d_j = \frac{c_{j+1} - c_j}{3h_j}$$

$$b_j + c_j h_j + d_j h_j^2 = \frac{a_{j+1} - a_j}{h_j}, \quad \text{so} \quad b_j = -\frac{h_j}{3}(2c_j + c_{j+1}) + \frac{a_{j+1} - a_j}{h_j}.$$

$$b_{j+1} = b_j + 2c_j h_j + 3d_j h_j^2, \quad \text{so} \quad b_{j+1} = b_j + h_j(c_j + c_{j+1}).$$

Last two equations do not involve  $d_j$ . Next get rid of  $b_j$ .

## The Splines Equations (V)

$$f'(x_0) = \frac{1}{h} \left[ -\frac{3}{2}f(x_0) + 2f(x_1) - \frac{1}{2}f(x_2) \right] + \frac{h^2}{3}f^{(3)}(\xi_0).$$

$$f'(x_0) = \frac{1}{h} \left[ -\frac{3}{2}f(x_0) + 2f(x_0 + h) - \frac{1}{2}f(x_0 + 2h) \right] + \frac{h^2}{3}f^{(3)}(\xi_0),$$

$$f'(x_0 + h) = \frac{1}{h} \left[ -\frac{1}{2}f(x_0) + \frac{1}{2}f(x_0 + 2h) \right] - \frac{h^2}{6}f^{(3)}(\xi_1),$$

$$f'(x_0 + 2h) = \frac{1}{h} \left[ \frac{1}{2}f(x_0) - 2f(x_0 + h) + \frac{3}{2}f(x_0 + 2h) \right] + \frac{h^2}{3}f^{(3)}(\xi_2).$$

## 5-point formulas, equi-spaced nodes

Choose  $x_1 = x_0 - h$ ,  $x_2 = x_0 - 2h$ ,  $x_3 = x_0 + h$ ,  $x_4 = x_0 + 2h$ , with  $h \neq 0$ .

$$f'(x_0) = \frac{1}{12h} [f(x_0 - 2h) - 8f(x_0 - h) + 8f(x_0 + h) - f(x_0 + 2h)] + \frac{h^4}{30} f^{(5)}(\xi),$$

...

## Second order derivatives, equi-spaced points

$$f(x_0 + h) = f(x_0) + f'(x_0)h + \frac{1}{2}f''(x_0)h^2 + \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_+)h^4,$$

$$f(x_0 - h) = f(x_0) - f'(x_0)h + \frac{1}{2}f''(x_0)h^2 - \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_-)h^4.$$

## Second order derivatives, equi-spaced points

$$f(x_0 + h) = f(x_0) + f'(x_0)h + \frac{1}{2}f''(x_0)h^2 + \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_+)h^4,$$

$$f(x_0 - h) = f(x_0) - f'(x_0)h + \frac{1}{2}f''(x_0)h^2 - \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_-)h^4.$$

Adding up, terms with difference signs cancel,

$$\begin{aligned} f(x_0 + h) + f(x_0 - h) &= 2f(x_0) + f''(x_0)h^2 + \frac{h^4}{24} \left( f^{(4)}(\xi_+) + f^{(4)}(\xi_-) \right) \\ &= 2f(x_0) + f''(x_0)h^2 + \frac{2h^4}{24} f^{(4)}(\xi). \end{aligned}$$

## Second order derivatives, equi-spaced points

$$f(x_0 + h) = f(x_0) + f'(x_0)h + \frac{1}{2}f''(x_0)h^2 + \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_+)h^4,$$

$$f(x_0 - h) = f(x_0) - f'(x_0)h + \frac{1}{2}f''(x_0)h^2 - \frac{1}{6}f'''(x_0)h^3 + \frac{1}{24}f^{(4)}(\xi_-)h^4.$$

Adding up, terms with difference signs cancel,

$$\begin{aligned} f(x_0 + h) + f(x_0 - h) &= 2f(x_0) + f''(x_0)h^2 + \frac{h^4}{24} \left( f^{(4)}(\xi_+) + f^{(4)}(\xi_-) \right) \\ &= 2f(x_0) + f''(x_0)h^2 + \frac{2h^4}{24} f^{(4)}(\xi). \end{aligned}$$

Therefore

$$f''(x_0) = \frac{f(x_0 + h) + f(x_0 - h) - 2f(x_0)}{h^2} - \frac{h^2}{12} f^{(4)}(\xi).$$

# Round-Off Error Instability

(For example) three-point midpoint formula

$$f'(x_0) = \frac{f(x_0 + h) - f(x_0 - h)}{2h} - \frac{h^2}{6}f^{(3)}(\xi).$$

- ▶ every step in the computation could incur round-off error.
- ▶ division by  $2h$  could magnify round-off error.

Assume round-off error model

$$f(x_0+h) = \widehat{f}(x_0+h) + e(x_0+h) \quad \text{and} \quad f(x_0-h) = \widehat{f}(x_0-h) + e(x_0-h),$$

where  $|e(x_0 + h)| \leq \epsilon$ ,  $|e(x_0 - h)| \leq \epsilon$ . No other round-off errors.

It follows

$$f'(x_0) - \frac{\widehat{f}(x_0 + h) - \widehat{f}(x_0 - h)}{2h} = \frac{e(x_0 + h) - e(x_0 - h)}{2h} - \frac{h^2}{6} f^{(3)}(\xi)$$

It follows

$$f'(x_0) - \frac{\widehat{f}(x_0 + h) - \widehat{f}(x_0 - h)}{2h} = \frac{e(x_0 + h) - e(x_0 - h)}{2h} - \frac{h^2}{6} f^{(3)}(\xi)$$
$$\left| f'(x_0) - \frac{\widehat{f}(x_0 + h) - \widehat{f}(x_0 - h)}{2h} \right| \leq \left| \frac{e(x_0 + h) - e(x_0 - h)}{2h} \right| + \frac{h^2}{6} |f^{(3)}(\xi)|.$$

Assume  $|e(x_0 + h)| \leq \epsilon$ ,  $|e(x_0 - h)| \leq \epsilon$  and  $|f^{(3)}(\xi)| \leq M$ , an upper bound on  $|f^{(3)}(x)|$ ,

$$\left| f'(x_0) - \frac{\widehat{f}(x_0 + h) - \widehat{f}(x_0 - h)}{2h} \right| \leq \frac{\epsilon}{h} + \frac{M h^2}{6} \stackrel{\text{def}}{=} e(h).$$

## Round-Off Error Instability: optimal $h$ choice

$$e(h) = \frac{\epsilon}{h} + \frac{M h^2}{6}$$

is smallest at

$$h_{\min} = \left(\frac{3\epsilon}{M}\right)^{\frac{1}{3}} = O\left(\epsilon^{\frac{1}{3}}\right),$$

with

$$e(h_{\min}) = \frac{1}{2} \left(\frac{9\epsilon^2}{M}\right)^{\frac{1}{3}} = O\left(\epsilon^{\frac{2}{3}}\right).$$
