# EFFECTIVE DYNAMICS OF DOUBLE SOLITONS FOR PERTURBED MKDV 

JUSTIN HOLMER, GALINA PERELMAN, AND MACIEJ ZWORSKI

#### Abstract

We consider the perturbed mKdV equation $\partial_{t} u=-\partial_{x}\left(\partial_{x}^{2} u+u^{3}-\right.$ $b(x, t) u)$ where the potential $b(x, t)=b_{0}(h x, h t), 0<h \ll 1$, is slowly varying with a double soliton initial data. On a dynamically interesting time scale the solution is $\mathcal{O}\left(h^{2}\right)$ close in $H^{2}$ to a double soliton whose position and scale parameters follow an effective dynamics, a simple system of ordinary differential equations. These equations are formally obtained as Hamilton's equations for the restriction of the mKdV Hamiltonian to the submanifold of solitons. The interplay between algebraic aspects of complete integrability of the unperturbed equation and the analytic ideas related to soliton stability is central in the proof.

## 1. Introduction

We consider 2-soliton solutions of the modified KdV equation with a slowly varying external potential (1.1). The purpose of the paper is to find minimal exact effective dynamics valid for a long time in the semiclassical sense and describing non-perturbative 2 -soliton interaction. In standard quantum mechanics the natural long time for which the semiclassical approximation is valid is the Ehrenfest time, $\log (1 / h) / h$ - see for instance [7]. The semiclassical parameter, $h$, quantifies the slowly varying nature of the potential.

Unlike in the case of single-particle semiclassical dynamics, that is, for the linear Schrödinger equation with a slowly varying potential, the exact effective dynamics valid for such a long time requires $h^{2}$-size corrections ${ }^{\dagger}$. Those corrections appeared as unspecified $\mathcal{O}\left(h^{2}\right)$ additions to Newton's equations (which give the usual semiclassical approximation) in the work of Fröhlich-Gustafson-Jonsson-Sigal [13] on 1-soliton propagation. That paper and its symplectic point of view were the starting point for [18, 19].

Following the 1 -soliton analysis of $[18,19]$ the semiclassical dynamics for 2-solitons considered here is obtained by restricting the Hamiltonian to the symplectic manifold of 2 -solitons and considering the finite dimensional dynamics there. The numerical experiments [17] show a remarkable agreement with the theorem below. However, they also reveal an interesting scenario not covered by our theorem: the velocities of

[^0]

Figure 1. A gallery of numerical experiments showing agreement with the results of the main theorem (clockwise from the left hand corner) for the external fields listed in (1.15) with the indicated initial data. The continuous lines are the numerically computed solutions and the dotted lines follow the evolution given by (1.4). The main theorem does not apply to the bottom two figures on the whole interval of time due to the crossing of $c_{j}$ 's - see Fig.3. In the first figure in the second line, (1.4) still apply directy, but in the second one further modification is needed to account for the signs.
the solitons can almost cross within exponentially small width in $h$ and the effective dynamics remains valid. Any long time analysis involving multiple interactions of solitons has to explain this avoided crossing which perhaps could be replaced by a direct crossing in a different parametrization. This seems the most immediate open problem of phenomenological interest.

The effective dynamics follows a long tradition of the use of modulation parameters in soliton propagation - see for instance $[8],[25],[26],[30],[32]$ and the numerous references given there. For non-linear dispersive equations with non-constant coefficients one can consult, in addition to [13], [3],[14],[15],[22], and references given there.

Here we avoid generality and, as described above, the aims are more modest: for the physically relevant cubic non-linearity we benefit from the completely integrable structure and using classical methods we can give a remarkably accurate and phenomenologically relevant description of 2 -soliton interaction. The equation (1.1) shares many features with the dynamical Gross-Pitaevskii equation,

$$
i \partial_{t} u=-\partial_{x}^{2} u-|u|^{2} u+V(x) u
$$

but is easier to study, mathematically and numerically. In a recent numerical study Potter [31] showed that the same effective dynamics applies very well to $N$-soliton trains in the case of perturbed mKdV and NLS. The soliton matter-wave trains created for Bose-Einstein condensates [33] were a good testing ground and our effective dynamics gives an alternative explanation of the observed phenomena. At the moment it is not clear how to obtain exact effective dynamics for the perturbed NLS.

The numerical results of [31] also indicate that the errors $\mathcal{O}\left(h^{2}\right)$ in NLS and mKdV evolution are optimal. For external potentials with nondegenerate maxima, the limiting Ehrenfest time $\log (1 / h) / h$ also appears to be optimal as the errors behave like $\mathcal{O}\left(h^{2} \exp (C h t)\right)$ - see $[31, \S 4.3]$ and (1.3) below.

To state the exact result we recall the perturbed mKdV equation [10],[11]:

$$
\begin{gather*}
\partial_{t} u=-\partial_{x}\left(\partial_{x}^{2} u-b(x, t) u+2 u^{3}\right), \\
b(x, t)=b_{0}(h x, h t), \quad 0<h \ll 1, \quad \partial^{\alpha} b_{0} \in L^{\infty}\left(\mathbb{R}^{2}\right) . \tag{1.1}
\end{gather*}
$$

For $b \equiv 0$ the equation is completely integrable and has a special class of $N$-soliton solutions, $q_{N}(x, a, c), a \in \mathbb{R}^{N}, c \in \mathbb{R}^{N}$ - see $\S 1.1$ and $\S 3$ below. For $N=2$ we obtain

Theorem. Let $\delta_{0}>0$ and $\bar{a}, \bar{c} \in \mathbb{R}^{n}$. Suppose that $u(x, t)$ solves (1.1) with

$$
\begin{equation*}
u(x, 0)=q_{2}(x, \bar{a}, \bar{c}), \quad\left|\bar{c}_{1} \pm \bar{c}_{2}\right|>2 \delta_{0}>0, \quad 2 \delta_{0}<\left|\bar{c}_{j}\right|<\left(2 \delta_{0}\right)^{-1} \tag{1.2}
\end{equation*}
$$

Then, for $t<T(h) / h$,

$$
\begin{equation*}
\left\|u(\cdot, t)-q_{2}(\cdot, a(t), c(t))\right\|_{H^{2}} \leq C h^{2} e^{C h t}, \quad C=C\left(\delta_{0}, b_{0}\right)>0 \tag{1.3}
\end{equation*}
$$

where $a(t)$ and $c(t)$ evolve according to the effective equations of motion,

$$
\begin{gather*}
\dot{a}_{j}=c_{j}^{2}-\operatorname{sgn}\left(c_{j}\right) \partial_{c_{j}} B(a, c, t), \quad \dot{c}_{j}=\operatorname{sgn}\left(c_{j}\right) \partial_{a_{j}} B(a, c, t) \\
B(a, c, t) \stackrel{\text { def }}{=} \frac{1}{2} \int b(x, t) q_{2}(x, a, c)^{2} d x . \tag{1.4}
\end{gather*}
$$

The upper bound $T(h) / h$ for the validity of (1.3) is given in terms of

$$
\begin{equation*}
T(h)=\min \left(\delta \log (1 / h), T_{0}(h)\right), \quad \delta=\delta\left(\delta_{0}, b_{0}\right)>0 \tag{1.5}
\end{equation*}
$$

where for $t<T_{0}(h) / h,\left|c_{1}(t) \pm c_{2}(t)\right|>\delta_{0}>0$ and $\delta_{0}<\left|c_{j}(t)\right|<\delta_{0}^{-1}$. Under the assumption (1.2) on $\bar{c}, T_{0}(h)>\delta_{2}$, where $\delta_{2}=\delta_{2}\left(\delta_{0}, b_{0}\right)>0$ is independent of $h$ - see (1.12).

Remarks. 1. We expect the same result to be true for all $N$ with $H^{2}$ replaced by $H^{N}$. For $N=1$ it follows directly from the arguments of [19]. That case is also implicit in this paper: single soliton dynamics describes the propagation away from the interaction region.
2. The Ehrenfest time bound, $T(h) \leq \delta \log (1 / h)$, is probably optimal if we insist on the agreement with classical equations of motion (1.4). We expect that the solution is close to a soliton profile $q_{2}(x, a, c)$ for much longer times ( $h^{-\infty}$ ?) but with a modified evolution for the parameters. One difficulty is the lack of a good description of the long time behaviour of time dependent linearized evolution with $b$ present - see $\S 8$. However, the modified equations would lack the transparency of (1.4) and would be harder to implement. The numerical study [31] suggests that for the minimal exact dynamics the error bound $\mathcal{O}\left(h^{2}\right)$ in (1.3) is optimal.
3. As shown by the top two plots in Fig. 1 the agreement of the approximations given by (1.4) and numerical solutions of (1.1) is remarkable. The codes are available at [17], see also §1.4. Experiments support the preceding remark.
4. The condition that $\left|c_{1}(t) \pm c_{2}(t)\right|>\delta_{1}$, that is, that the perturbed effective dynamics avoids the lines shown in Fig.2, could most likely be relaxed. Allowing that provides more interesting dynamics as then the solitons can interact multiple times. As discussed in $\S 1.2$ and Appendix B, we expect avoided crossing after $\pm c_{j}(t)$ 's get within $\exp (-c / h)$ of each other - see Fig.3. Examples of such evolution, and the comparisons with effective dynamics, are shown in the lower two plots in Fig.1. On closer inspection the agreement between the solutions and solitons moving according to effective dynamics is not as dramatic as in the case when $\pm c_{j}$ 's stay away from each other but for smaller values of $h$ the result should still hold. We concentrated on the simpler case at this early stage.
5. The equation (1.1) is globally well-posed in $H^{k}, k \geq 1$ under even milder regularity hypotheses on $b$. This can be shown by modifying the techniques of Kenig-PonceVega [21] - see Appendix A. Although for $k \geq 2$ more classical methods are available, we opt for a self-contained treatment dealing with all $H^{k}$ 's at once.
6. Studies of single solitons for perturbed KdV , mKdV , and their generalizations were conducted by Dejak-Jonsson [10] and Dejak-Sigal [11]. The perturbative terms, $b(x, t)$, were assumed to be not only slow varying but also small in size. The mKdV results of [10] are improved by following [19]. For KdV one does not expect the same behaviour as for mKdV and the $\mathcal{O}\left(h^{2}\right)$-approximation similar to (1.3) is not valid see the recent work by Muuñoz [28] and the first author [16] for finer analysis of that case.

Figure 2. On the left we show $\mathbb{R}^{2} \backslash \mathcal{C}$ and on the right examples of double solitons corresponding to $\left(c_{1}, c_{2}\right)$ indicated on the left (with $a_{1}=a_{2}=0$ in the first figure and $a_{2}=-a_{1}=1$, in the other two). At the coordinate axes the double soliton degenerates into a single soliton. As one approaches the lines $c_{1}= \pm c_{2}$ the solitons escape to infinities in opposite direction.
7. The conditions that $u(x, 0)=q_{2}(x, \bar{a}, \bar{c})$ can be relaxed by allowing a small perturbation in $H^{2}$ - see [9] for the adaptation of [19] to that case. Similar statements are possible here but we prefer the simpler formulation both in the statement of the theorem and in the proofs.

In the remainder of the introduction we will explain the origins of the effective dynamics (1.4), outline the proof, and comment on numerical experiments.
1.1. Double solitons for $\mathbf{m K d V}$. The single soliton solutions to $\mathrm{mKdV},(1.1)$ with $b \equiv 0$, are described in terms of the profile $\eta(x, a, c)$ as follows. Let $\eta(x)=\operatorname{sech} x$ so that $-\eta+\eta^{\prime \prime}+2 \eta^{3}=0$, and let $\eta(x, c, a)=c \eta(c(x-a))$ for $a \in \mathbb{R}, c \in \mathbb{R} \backslash 0$. Then a single soliton defined by

$$
u(x, t)=\eta\left(x, a+c^{2} t, c\right)
$$

is easily verified to be an exact solution to mKdV. Such solitary wave solutions are available for many nonlinear evolution equations. However, mKdV has richer structure - it is completely integrable and can be studied using the inverse scattering method (Miura [27], Wadati [35]). One of the consequences is the availability of larger families of explicit solutions. In the case of mKdV, we have $N$-solitons and breathers. In this paper we confine our attention to the 2 -soliton (or double soliton), which is described by the profile $q_{2}(x, a, c)$ defined in (3.2) below. The four real
parameters, $a \in \mathbb{R}^{2}$, and $c \in \mathbb{R}^{2} \backslash \mathcal{C}$,

$$
\mathcal{C} \stackrel{\text { def }}{=}\left\{\left(c_{1}, c_{2}\right): c_{1}= \pm c_{2}\right\} \cup \mathbb{R} \times\{0\} \cup\{0\} \times \mathbb{R}
$$

describe the position ( $a$ ) and scale ( $c$ ) of the double soliton. At the diagonal lines the parametrization degenerates: for $c_{1}= \pm c_{2}, q_{2} \equiv 0$. At the coordinate axes in the $c$ space, we recover single solitons:

$$
q_{2}\left(x, a,\left(c_{1}, 0\right)\right)=-c_{1} \eta\left(x, a_{1}, c_{1}\right), \quad q_{2}\left(x, a,\left(0, c_{2}\right)\right)=c_{2} \eta\left(x, a_{2}, c_{2}\right)
$$

Fig. 2 shows a few examples.
Solving mKdV with $u(x, 0)=q_{2}(x, a, c)$ gives the solution

$$
u(x, t)=q_{2}\left(x, a_{1}+t c_{1}^{2}, a_{2}+t c_{2}^{2}, c\right)
$$

that is, the double soliton solution.
If, say, $0<c_{1}<c_{2}$, then for $\left|a_{1}-a_{2}\right|$ large,

$$
q(x, a, c) \approx \eta\left(x, a_{1}+\alpha_{1}, c_{1}\right)+\eta\left(x, a_{2}+\alpha_{2}, c_{2}\right)
$$

where $\alpha_{j}$ are shifts defined in terms of $c$, see Lemma 3.2 for the precise statement. This means that for large positive and negative times the evolving double soliton is effectively a sum of single solitons. The decomposition can be made exact preserving the particle-like nature of single solitons even during the interaction - see (3.11) and Fig. 4.

We consider the set of 2 -solitons as a submanifold of $H^{2}(\mathbb{R} ; \mathbb{R})$ with 8 open components corresponding to the components of $\mathbb{R}^{2} \backslash \mathcal{C}$ :

$$
\begin{equation*}
M=\left\{q(\cdot, a, c) \mid a=\left(a_{1}, a_{2}\right) \in \mathbb{R}^{2}, c=\left(c_{1}, c_{2}\right) \in \mathbb{R}^{2} \backslash \mathcal{C}\right\} \tag{1.6}
\end{equation*}
$$

As in the case of single solitons this submanifold is symplectic with respect to the natural structure recalled in the next subsection.
1.2. Dynamical structure and effective equations of motion. The equation (1.1) is a Hamiltonian equation of evolution for

$$
\begin{equation*}
H_{b}(u)=\frac{1}{2} \int\left(u_{x}^{2}-u^{4}+b u^{2}\right) d x \tag{1.7}
\end{equation*}
$$

on the Schwartz space, $\mathcal{S}(\mathbb{R} ; \mathbb{R})$ equipped with the symplectic form

$$
\begin{equation*}
\omega(u, v)=\frac{1}{2} \int_{-\infty}^{+\infty} \int_{-\infty}^{x}(u(x) v(y)-u(y) v(x)) d y d x \tag{1.8}
\end{equation*}
$$

In other words, (1.1) is equivalent to

$$
\begin{equation*}
u_{t}=\partial_{x} H_{b}^{\prime}(u),\left.\quad\left\langle H_{b}^{\prime}(u), \varphi\right\rangle \stackrel{\text { def }}{=} \frac{d}{d s} H_{b}(u+s \varphi)\right|_{s=0} \tag{1.9}
\end{equation*}
$$

and $\partial_{x} H_{b}^{\prime}(u)$ is the Hamilton vector field of $H_{b}, \Xi_{H_{b}}$, with respect to $\omega$ :

$$
\omega\left(\varphi, \Xi_{H_{b}}(u)\right)=\left\langle H_{b}^{\prime}(u), \varphi\right\rangle .
$$

For $b=0, \Xi_{H_{0}}$ is tangent to the manifold of solitons (1.6). Also, $M$ is symplectic with respect to $\omega$, that is, $\omega$ is nondegenerate on $T_{u} M, u \in M$. Using the stability theory for 2-solitons based on the work of Maddocks-Sachs [24], and energy methods (enhanced and simplified using algebraic identities coming from complete integrability of mKdV) we will show that the solution to (1.1) with initial data on $M$ stays close to $M$ for $t \leq \log (1 / h) / h$.

A basic intuition coming from symplectic geometry then indicates that $u(t)$ stays close to an integral curve on $M$ of the Hamilton vector field (defined using $\left.\omega\right|_{M}$ ) of $H_{b}$ restricted to $M$ :

$$
\begin{gather*}
\left.H_{\mathrm{eff}}(a, c) \stackrel{\text { def }}{=} H_{b}\right|_{M}(a, c)=\left.H_{0}\right|_{M}(a, c)+\frac{1}{2} \int b(x) q_{2}(x, a, c)^{2} d x \\
\left.H_{0}\right|_{M}(a, c)=-\frac{1}{3}\left(\left|c_{1}\right|^{3}+\left|c_{2}\right|^{3}\right) \\
\left.\omega\right|_{M}=d a_{1} \wedge d\left|c_{1}\right|+d a_{2} \wedge d\left|c_{2}\right|  \tag{1.10}\\
\Xi_{H_{\mathrm{eff}}}=\sum_{j=1}^{2} \operatorname{sgn}\left(c_{j}\right)\left(\partial_{a_{j}} H_{\mathrm{eff}} \partial_{c_{j}}-\partial_{c_{j}} H_{\mathrm{eff}} \partial_{a_{j}}\right) .
\end{gather*}
$$

The effective equations of motion (1.4) follow. This simple but crucial observation was made in [18],[19] and it did not seem to be present in earlier mathematical work on solitons in external fields [13].

The condition made in the theorem, that $\left|c_{1}(t) \pm c_{2}(t)\right|$ and $\left|c_{j}(t)\right|$ are bounded away from zero for $t<T_{0}(h) / h$ (where $T_{0}(h)$ could be $\infty$ ), follows from a condition involving a simpler system of decoupled $h$-independent ODEs - see Appendix B. Here we state a condition which gives an $h$-independent $T_{0}$ appearing in (1.5).

Suppose we are given $b(x, t)=b_{0}(h x, h t)$ in (1.1) and the initial condition is given by $q_{2}(x, \bar{a}, \bar{c}), \bar{a}=\left(\bar{a}_{1}, \bar{a}_{2}\right), \bar{c}=\left(\bar{c}_{1}, \bar{c}_{2}\right),\left|\bar{c}_{1} \pm \bar{c}_{2}\right|>\delta_{0},\left|\bar{c}_{j}\right|>\delta_{0}$, We consider an $h$-independent system of two decoupled differential equations for

$$
A(T)=\left(A_{1}(T), A_{2}(T)\right), \quad C(T)=\left(C_{1}(T), C_{2}(T)\right),
$$

given by

$$
\left\{\begin{array}{l}
\partial_{T} A_{j}=C_{j}^{2}-b_{0}\left(A_{j}, T\right)  \tag{1.11}\\
\partial_{T} C_{j}=C_{j} \partial_{x} b_{0}\left(A_{j}, T\right)
\end{array}, \quad A(0)=\bar{a} h, \quad C(0)=\bar{c}, \quad j=1,2\right.
$$

Then, for a given $\delta_{1}<\delta_{0}, T_{0}(h)$ in (1.5) can be replaced by

$$
\begin{equation*}
T_{0} \stackrel{\text { def }}{=} \sup \left\{T:\left|C_{1}(T) \pm C_{2}(T)\right|>\delta_{1},\left|C_{j}(T)\right|>\delta_{1}, \quad j=1,2\right\} . \tag{1.12}
\end{equation*}
$$

1.3. Outline of the proof. To obtain the effective dynamics we follow a long tradition (see [13] and references given there) and define the modulation parameters

$$
a(t)=\left(a_{1}(t), a_{2}(t)\right), \quad c(t)=\left(c_{1}(t), c_{2}(t)\right),
$$

Figure 3. The plots of $c$ and $a$ for the external potential given by the last $b(x, t)$ in (1.15), and $\bar{c}=(6,10), \bar{a}=(-1,-2)$. We see the avoided crossings near times at which the decoupled dynamics (1.11) would give a crossing of $c_{j}$ 's (see also Fig.6). The crossings are avoided with $\exp (-1 / C h)$ width and $a_{1}=a_{2}$ at the crossings. These cases are not yet covered by our theory. Of the five crossings of $a_{j}$ 's in the bottom figure, three do not involve crossings of $c_{j}$ 's are hence the description by effective dynamics there is covered by our theorem. However, in the absence of avoided crossing of $c_{j}$ 's the solitons can interact only once.
be demanding that

$$
v(x, t)=u(x, t)-q(x, a(t), c(t)), \quad q=q_{2}
$$

satisfies symplectic orthogonality conditions:

$$
\begin{array}{ll}
\omega\left(v, \partial_{a_{1}} q\right)=0 & \omega\left(v, \partial_{a_{2}} q\right)=0 \\
\omega\left(v, \partial_{c_{1}} q\right)=0 & \omega\left(v, \partial_{c_{2}} q\right)=0
\end{array}
$$

These can be arranged by the implicit function theorem thanks to the nondegeneracy of $\left.\omega\right|_{M}$. This makes $q$ the symplectic orthogonal projection of $u$ onto the manifold of solitons $M$.

Since $u=q+v$ and $u$ solves $m K d V$, we have

$$
\begin{equation*}
\partial_{t} v=\partial_{x}\left(\mathcal{L}_{c, a} v-6 q v^{2}-2 v^{3}+b v\right)-F_{0} \tag{1.13}
\end{equation*}
$$

where

$$
\mathcal{L}_{c, a}=-\partial_{x}^{2}-6 q(x, a, c)^{2} v
$$

and $F_{0}$ results from the perturbation and $\partial_{t}$ landing on the parameters:

$$
F_{0}=\sum_{j=1}^{2}\left(\dot{a}_{j}-c_{j}^{2}\right) \partial_{a_{j}} q+\sum_{j=1}^{2} \dot{c}_{j} \partial_{c_{j}} q-\partial_{x}(b q) .
$$

We decompose $F_{0}=F_{\|}+F_{\perp}$, where $F_{\|}$is symplectic projection of $F_{0}$ onto $T_{q} M$, and $F_{\perp}$ is the symplectic projection onto its symplectic orthogonal $\left(T_{q} M\right)^{\perp}$. As seen in (5.4), $F_{\|} \equiv 0$ is equivalent to the equations of motion (1.4) (we assume in the proof that $c_{2}>c_{1}>0$ ).

Using the properties of $q$, we show that $F_{\perp}$ is $\mathcal{O}\left(h^{2}\right)$. In fact it is important to obtain a specific form for the $\mathcal{O}\left(h^{2}\right)$ term so that it is amenable to finding a certain correction term later - see $\S 6$.

The estimates for $F_{\|}$are obtained using the symplectic orthogonality properties of $v$. For example, $0=\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle$ implies

$$
0=\partial_{t}\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=\langle\underbrace{\partial_{t} v}_{\substack{\uparrow \\ \text { substitute equation (1.13) }}}, \partial_{x}^{-1} \partial_{a_{j}} q\rangle+\left\langle v, \partial_{t} \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle
$$

which can be used to show that

$$
\begin{equation*}
\left|F_{\|}\right| \leq C h^{2}\|v\|_{H^{2}}+\|v\|_{H^{2}}^{2} \tag{1.14}
\end{equation*}
$$

see $\S 7$.
The next step is to estimate $v$ satisfying (1.13) with $v(0)=\mathcal{O}\left(h^{2}\right)$ (in the theorem $v(0)=0$, but we need this relaxed assumption for the bootstrap argument). We want to show that on a time interval of length $h^{-1}$, that $v$ at most doubles. The Lyapunov functional $\mathcal{E}(t)$ that we use to achieve this comes from the variational characterization of the double soliton (see $[23, \S 2]$ and Lemma 4.1 below): if

$$
H_{c}(u)=I_{5}(u)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}(u)+c_{1}^{2} c_{2}^{2} I_{1}(u),
$$

then

$$
H_{c}^{\prime}(q(\cdot, a, c))=0, \quad \forall a \in \mathbb{R}^{2}
$$

and

$$
H_{c}^{\prime \prime}(q(\cdot, a, c))=\mathcal{K}_{c, a}
$$

where $\mathcal{K}_{c, a}$ is a fourth order operator given in (4.11) below. Hence

$$
\mathcal{E}(t) \stackrel{\text { def }}{=} H_{c(t)}(q(\bullet, a(t), c(t))+v(t))-H_{c(t)}(q(\bullet, a(t), c(t))),
$$

satisfies

$$
\mathcal{E}(t) \approx\left\langle\mathcal{K}_{c, a} v, v\right\rangle
$$

and, as in Maddocks-Sachs [24] for $\mathrm{KdV}, \mathcal{K}_{c, a}$ has a two dimensional kernel and one negative eigenvalue. However, the symplectic orthogonality conditions on $v$ imply that we project far enough away from these eigenspaces and hence we have the coercivity

$$
\delta\|v\|_{H^{2}}^{2} \leq \mathcal{E}(t)
$$

To get the upper bound on $\mathcal{E}(t)$, we compute

$$
\frac{d}{d t} \mathcal{E}(t)=\mathcal{O}(h)\|v(t)\|_{H^{2}}^{2}+\left\langle\mathcal{K}_{c, a} v, F_{\|}\right\rangle+\left\langle\mathcal{K}_{c, a} v, F_{\perp}\right\rangle
$$

see §9. Using (1.14) we can estimate the second term on the right-hand side but $\left|F_{\perp}\right|=\mathcal{O}\left(h^{2}\right)$ only. We improve this to $h^{3}$ using a correction term to $v-$ see $\S 8$, and the comment at the end of this section.

All of this combined gives, on $[0, T]$,

$$
\begin{gathered}
\|v\|_{H^{2}}^{2} \lesssim\|v(0)\|_{H^{2}}^{2}+T\left(\left|F_{\|}\right|\|v\|_{H^{2}}+h^{2}\|v\|_{H^{2}}+\|v\|_{H^{2}}^{2}\right) \\
\left|F_{\|}\right| \leq C h^{2}\|v\|_{H^{2}}+\|v\|_{H^{2}}^{2},
\end{gathered}
$$

which implies

$$
\|v\|_{H^{2}} \lesssim h^{2}, \quad\left|F_{\|}\right| \lesssim h^{4}, \quad \text { on }\left[0, h^{-1}\right] .
$$

Iterating the argument $\delta \log (1 / h)$ times gives a slightly weaker bound for longer times. The $O\left(h^{4}\right)$ errors in the ODEs can be removed without affecting the bound on $v$, proving the theorem.

In the proofs various facts due to complete integrability (such as the miraculous Lemma 2.1) simplify the arguments, in particular in the above energy estimate.

We conclude with the remark about the correction term added to $v$ in order to improve the bound on $\left\|F_{\perp}\right\|$ from $h^{2}$ to $h^{3}$. A similar correction term was used in [19] for NLS 1-solitons. Together with the symplectic projection interpretation, it was the key to sharpening the results in earlier works. Implementing the same idea in the setting of 2-solitons is more subtle. The 2-soliton is treated as if it were the sum of two decoupled 1-solitons, the corrections are introduced for each piece, and the result is that $F_{\perp}$ is corrected so that

$$
\left\|F_{\perp}\right\|_{H^{2}} \lesssim h^{3}+h^{2} e^{-\gamma\left|a_{1}-a_{2}\right|}
$$

That is, when $\left|a_{1}-a_{2}\right|=O(1)$, there is no improvement. However, this happens only on an $O(1)$ time scale and hence does not spoil the long time estimate.
1.4. Numerical experiments. Unlike NLS, KdV is a very friendly equation from the numerical point of view and MATLAB is sufficient for producing good results.

We first describe the simple codes on which our experiments are based. Instead of considering (1.1) on the line, we consider it on the circle identified with $[-\pi, \pi)$. To solve it numerically we adapt the code given in [34, Chapter 10] which is based on the Fast Fourier Transform in $x$, the method of integrating factor for the $-u_{x x x} \mapsto$ $-i k^{3} \hat{u}(k)$ term, and the fourth-order Runge-Kutta formula for the resulting ODE in time. Unless the amplitude of the solution gets large (which results in large terms in the equation due to the $u^{3}$ term) it suffices to take $2^{N}, N=8$, discretization points in $x$.

For $X \in[-\pi, \pi)$ we consider $B(X, T)$ periodic in $X$, and compute $U(X, T)$ satisfying

$$
\partial_{T} U=-\partial_{X}\left(\partial_{X}^{2} U+2 U^{3}-B(X, T) U\right), \quad U(\pi, T)=U(-\pi, T)
$$

A simple rescaling,

$$
u(x, t)=\alpha U\left(\alpha x, \alpha^{3} t\right), \quad b(x, t)=\alpha^{2} B\left(\alpha x, \alpha^{3} t\right)
$$

gives a solution of (1.1) on $[-\pi / \alpha, \pi / \alpha]$ with periodic boundary conditions. When $\alpha$ is small this is a good approximation of the equation on the line. If we use $U(X, T)$ in our numerical calculations with the initial data $q_{2}(X, A, C), A \in \mathbb{R}^{2}, C \in \mathbb{R}^{2} \backslash \mathcal{C}$, the initial condition on for $u(x, t)$ is given by

$$
u(x, 0)=q_{2}(x, A / \alpha, \alpha C)
$$

If we want $\bar{c}=\alpha C$ to satisfy the assumptions (1.2), the effective small constant $h$ becomes $h=\alpha$ and $b_{0}$ in (1.1) becomes

$$
b_{0}(x, t)=h^{2} B\left(x, h^{2} t\right)
$$

In principle we have three scales: size of $B$, size of $\partial_{x} B$, and size of $\partial_{t} B$, which should correspond to three small parameters $h$. For simplicity we just use one scale $h$ in the Theorem.

Figure 1 shows four examples of evolution and comparison with effective dynamics computed using the MATLAB codes available at [17]. The external potentials used are given by

$$
\begin{align*}
& B(x, t)=100 \cos ^{2}\left(x-10^{3} t\right)-50 \sin \left(2 x+10^{3} t\right) \\
& B(x, t)=100 \cos ^{2}\left(x-10^{3} t\right)+50 \sin \left(2 x+10^{3} t\right)  \tag{1.15}\\
& B(x, t)=60 \cos ^{2}\left(x+1-10^{2} t\right)+40 \sin \left(2 x+2+10^{2} t\right) \\
& B(x, t)=40 \cos \left(2 x+3-10^{2} t\right)+30 \sin \left(x+1+10^{2} t\right)
\end{align*}
$$

The rescaling the fixed size potential used in the theorem, $b_{0}(x, t)=h^{2} B\left(x, h^{2} t\right)$, means that our $h$ satisfies $h \simeq 1 / 5$ in the last two examples. In the first two examples the scales in $x$ are different than the ones in $t$ : the potential is not slowly varying in $t$ if $h \simeq 1 / 10$. The agreement with the main theorem is very good in all cases. However, the theorem in the current version does not apply to the two bottom figures since the condition in (1.12) is not satisfied for the full time of the experiment. See also Fig. 3 and Appendix B.

We have not exploited numerical experiments in a fully systematic way but the following conclusions can be deduced:

- For the case covered by our theorem the agreement with the numerical solution is remarkably close; the same thing is true for times longer than $T_{0} / h$, with $T_{0}$ defined by (1.12) despite the crossings of $C_{j}$ 's (resulting in the avoided crossing of $c_{j}$ 's) The agreement is weaker but the experiments involve only relatively large value of $h$.
- The soliton profile persists for long times but we see a deviation from the effective dynamics. This suggest the optimality of the bound $\log (1 / h) / h$ in (1.3).
- The slow variation in $t$ required in the theorem can probably be relaxed. For instance, in the top plots in Fig. $1 \max \left|\partial_{t} b_{0}\right| / \max \left|\partial_{x} b_{0}\right| \sim 10$, while the agreement with the effective dynamics is excellent. For longer times it does break down as can be seen using the Bmovie.m code presented in [17, §3]. An indication that slow variation in time might be removable also comes from [2].
- When the decoupled equations (1.11) predict crossing of $C_{j}$ 's, we observe an avoided crossing of $c_{j}$ 's - see Fig. 3 and Fig. 6 - with exponentially small width, $\exp (-1 / C h)$. At such times we also see the crossing of $a_{j}$ 's, though it really corresponds to solitons changing their scale constants - see Fig.7. To have multiple interactions of a pair of solitons, this type of crossing has to occur, and it needs to be investigated further.
1.5. Acknowledgments. The authors gratefully acknowledge the following sources of funding: J.H. was supported in part by a Sloan fellowship and the NSF grant DMS-0901582, G.P's visit to Berkeley in November of 2008 was supported in part by the France-Berkeley Fund, and M.Z. was supported in part by the NSF grant DMS-0654436.

## 2. Hamiltonian structure and conserved quantities

The symplectic form, at first defined on $\mathcal{S}(\mathbb{R} ; \mathbb{R})$ is given by

$$
\begin{equation*}
\omega(u, v) \stackrel{\text { def }}{=}\left\langle u, \partial_{x}^{-1} v\right\rangle, \quad\langle f, g\rangle=\int f g \tag{2.1}
\end{equation*}
$$

where

$$
\partial^{-1} f(x) \stackrel{\text { def }}{=} \frac{1}{2}\left(\int_{-\infty}^{x}-\int_{x}^{+\infty}\right) f(y) d y
$$

Then the mKdV (equation (1.1) with $b \equiv 0$ ) is the Hamiltonian flow $\partial_{t} u=\partial_{x} H_{0}^{\prime}(u)$ and (1.1) is the Hamiltonian flow $\partial_{t} u=\partial_{x} H_{b}^{\prime}(u)$, where

$$
H_{0}=\frac{1}{2} \int\left(u_{x}^{2}-u^{4}\right) \quad H_{b}=\frac{1}{2} \int\left(u_{x}^{2}-u^{4}+b u^{2}\right)
$$

Solutions to mKdV have infinitely many conserved integrals and the first four are given by

$$
\begin{aligned}
& I_{0}(u)=\int u d x \\
& I_{1}(u)=\int u^{2} d x \\
& I_{3}(u)=\int\left(u_{x}^{2}-u^{4}\right) d x \\
& I_{5}(u)=\int\left(u_{x x}^{2}-10 u_{x}^{2} u^{2}+2 u^{6}\right) d x
\end{aligned}
$$

which are the mass, momentum, energy, and second energy, respectively. In this paper we will only use these particular conserved quantities.

We write $I_{j}(u)=\int A_{j}(u)$, which means that $A_{j}(u)$ denotes the $j$-th Hamiltonian density.

For future reference, we record the expressions appearing in the Taylor expansions of these densities,

$$
\begin{align*}
A_{j}(q+v) & =A_{j}(q)+A_{j}^{\prime}(q)(v)+\frac{1}{2} A^{\prime \prime}(q)(v, v)+\mathcal{O}\left(v^{3}\right)  \tag{2.2}\\
A_{1}^{\prime}(q)(v) & =2 q v \\
A_{3}^{\prime}(q)(v) & =2 q_{x} v_{x}-4 q^{3} v \\
A_{5}^{\prime}(q)(v) & =2 q_{x x} v_{x x}-20 q_{x} q^{2} v_{x}-20 q_{x}^{2} q v+12 q^{5} v
\end{align*}
$$

and

$$
\begin{aligned}
& A_{1}^{\prime \prime}(q)(v, v)=2 v^{2} \\
& A_{3}^{\prime \prime}(q)(v, v)=2 v_{x}^{2}-12 q^{2} v^{2} \\
& A_{5}^{\prime \prime}(q)(v, v)=2 v_{x x}^{2}-20 q^{2} v_{x}^{2}-20 q_{x}^{2} v^{2}-80 q q_{x} v v_{x}+60 q^{4} v^{2} .
\end{aligned}
$$

The differentials, $I_{j}^{\prime}(q)$, are identified with functions by writing:

$$
\left\langle I_{j}^{\prime}(q), v\right\rangle=\int A_{j}^{\prime}(q)(v)
$$

It is useful to record a formal expression for $I_{j}^{\prime}(q)$ 's valid when $A_{j}(q)$ 's are polynomials in $\partial_{x}^{\ell} q$ :

$$
\begin{equation*}
I_{j}^{\prime}(q)=\sum_{\ell \geq 0}\left(-\partial_{x}\right)^{\ell} \frac{\partial A_{j}(q)}{\partial q_{x}^{(\ell)}}, \quad q_{x}^{(\ell)}=\partial_{x}^{\ell} q \tag{2.3}
\end{equation*}
$$

The Hessians, $I_{j}^{\prime \prime}(q)$, are the (self-adjoint) operators given by

$$
\left\langle I_{j}^{\prime \prime}(q) v, v\right\rangle=\int A_{j}^{\prime \prime}(q)(v, v)
$$

One way to generate the mKdV energies is as follows (see Olver [29]). Let us put

$$
\Lambda(u)=-\partial_{x}^{2}-4 u^{2}-4 u_{x} \partial_{x}^{-1} u
$$

and recall that $\Lambda(u) \partial_{x}$ is skew-adjoint:

$$
\begin{aligned}
\Lambda(u) \partial_{x} & =-\partial_{x}^{3}-4 u^{2} \partial_{x}-4 u_{x} \partial_{x}^{-1} u \partial_{x} \\
& =-\partial_{x}^{3}-4 u^{2} \partial_{x}-4 u_{x} u+4 u_{x} \partial_{x}^{-1} u_{x}
\end{aligned}
$$

where we used the formal integration by parts $\partial_{x}^{-1}\left(u f_{x}\right)=-\partial_{x}^{-1}\left(u_{x} f\right)+u f$.
With this notation we have the fundamental recursive identity:

$$
\begin{equation*}
\partial_{x} I_{2 k+1}^{\prime}(u)=\Lambda(u) \partial_{x} I_{2 k-1}^{\prime}(u), \tag{2.4}
\end{equation*}
$$

which together with skew-adjointness of $\Lambda(u) \partial_{x}$ shows that

$$
\left\langle I_{j}^{\prime}(u), \partial_{x} I_{k}^{\prime}(u)\right\rangle=\left\langle I_{j-2}^{\prime}(u), \partial_{x} I_{k+2}^{\prime}(u)\right\rangle
$$

for $j$ and $k$ odd (if we use (2.4) with $m$ even the choice $I_{2 m}(u)=0$, for $m>0$ is consistent). By iteration this shows that

$$
\begin{equation*}
\left\langle I_{j}^{\prime}(u), \partial_{x} I_{k}^{\prime}(u)\right\rangle=0, \quad \forall j, k \tag{2.5}
\end{equation*}
$$

In fact, since $j$ and $k$ are odd we can iterate all the way down to $j=1$ and apply (2.3):

$$
\begin{aligned}
\left\langle I_{1}^{\prime}(u), \partial_{x} I_{k+j-1}^{\prime}(u)\right\rangle & =-\left\langle\partial_{x} u_{x}^{(\ell)}, \sum_{\ell \geq 0} \partial A_{j+k-1}(u) / \partial u_{x}^{(\ell)}\right\rangle \\
& =-\int \partial_{x}\left(A_{j+k-1}(u)\right) d x=0
\end{aligned}
$$

If $u$ solves mKdV , then $\partial_{t} u=\frac{1}{2} \partial_{x} I_{3}^{\prime}(u)$ and hence by (2.5) we obtain

$$
\partial_{t} I_{j}(u)=\left\langle I_{j}^{\prime}(u), \partial_{t} u\right\rangle=\frac{1}{2}\left\langle I_{j}^{\prime}(u), \partial_{x} I_{3}^{\prime}(u)\right\rangle=0
$$

The following identities related to the conservation laws will be needed in $\S 9$. Recalling the definition (2.2) of $A_{j}$, we have:

Lemma 2.1. For any function $u \in \mathcal{S}$, and for $b \in C^{\infty} \cap \mathcal{S}^{\prime}$, we have

$$
\begin{aligned}
& \left\langle I_{1}^{\prime}(u),(b u)_{x}\right\rangle=\left\langle b_{x}, A_{1}(u)\right\rangle \\
& \left\langle I_{3}^{\prime}(u),(b u)_{x}\right\rangle=3\left\langle b_{x}, A_{3}(u)\right\rangle-\left\langle b_{x x x}, A_{1}(u)\right\rangle \\
& \left\langle I_{5}^{\prime}(u),(b u)_{x}\right\rangle=5\left\langle b_{x}, A_{5}(u)\right\rangle-5\left\langle b_{x x x}, A_{3}(u)\right\rangle+\left\langle b_{x x x x x}, A_{1}(u)\right\rangle
\end{aligned}
$$

Proof. By taking arbitrary $b \in \mathcal{S}$, we see that the claimed formulae are equivalent to

$$
\begin{aligned}
& u \partial_{x} I_{1}^{\prime}(u)=\partial_{x} A_{1}(u) \\
& u \partial_{x} I_{3}^{\prime}(u)=3 \partial_{x} A_{3}(u)-\partial_{x}^{3} A_{1}(u) \\
& u \partial_{x} I_{5}^{\prime}(u)=5 \partial_{x} A_{5}(u)-5 \partial_{x}^{3} A_{3}(u)+\partial_{x}^{5} A_{1}(u)
\end{aligned}
$$

and these can be checked by direct computation.
Lemma 2.2. For any function $u, q \in \mathcal{S}$, and for $b \in C^{\infty} \cap \mathcal{S}^{\prime}$, we have

$$
\begin{aligned}
\left\langle I_{1}^{\prime \prime}(q) v,(b q)_{x}\right\rangle-\left\langle\partial_{x} I_{1}^{\prime}(q), b v\right\rangle= & \left\langle b_{x}, A_{1}^{\prime}(q)(v)\right\rangle \\
\left\langle I_{3}^{\prime \prime}(q) v,(b q)_{x}\right\rangle-\left\langle\partial_{x} I_{3}^{\prime}(q), b v\right\rangle= & 3\left\langle b_{x}, A_{3}^{\prime}(q)(v)\right\rangle-\left\langle b_{x x x}, A_{1}^{\prime}(q)(v)\right\rangle \\
\left\langle I_{5}^{\prime \prime}(q) v,(b q)_{x}\right\rangle-\left\langle\partial_{x} I_{5}^{\prime}(q), b v\right\rangle= & 5\left\langle b_{x}, A_{5}^{\prime}(q)(v)\right\rangle-5\left\langle b_{x x x}, A_{3}^{\prime}(q)(v)\right\rangle \\
& +\left\langle b_{x x x x x}, A_{1}^{\prime}(q)(v)\right\rangle
\end{aligned}
$$

Proof. Differentiate the formulæ in Lemma 2.1 with respect to $u$ at $q$ in the direction of $v$.

## 3. Double soliton profile and properties

Here we record some properties of mKdV and its double soliton solutions. The parametrization of the family of double solitons follows the presentation for NLS in Faddeev-Takhtajan [12].

The double-soliton is defined in terms of the profile $q(x, a, c)$, where

$$
\begin{gather*}
a=\left(a_{1}, a_{2}\right) \in \mathbb{R}^{2}, \quad c=\left(c_{1}, c_{2}\right) \in \mathbb{R}^{2} \backslash \mathcal{C} \\
\mathcal{C} \stackrel{\text { def }}{=}\left\{\left(c_{1}, c_{2}\right): c_{1}= \pm c_{2}\right\} \cup \mathbb{R} \times\{0\} \cup\{0\} \times \mathbb{R} . \tag{3.1}
\end{gather*}
$$

The profile $q=q_{2}$ (from now on we drop the subscript 2 ) is defined by

$$
\begin{equation*}
q(x, a, c)=\frac{\operatorname{det} M_{1}}{\operatorname{det} M} \tag{3.2}
\end{equation*}
$$

where

$$
M=\left[M_{i j}\right]_{1 \leq i, j \leq 2}, \quad M_{i j}=\frac{1+\gamma_{i} \gamma_{j}}{c_{i}+c_{j}}, \quad M_{1}=\left[\begin{array}{c|c}
M & \gamma_{1} \\
\hline 1 & 1
\end{array}\right]
$$

and

$$
\gamma_{j}=(-1)^{j-1} \exp \left(-c_{j}\left(x-a_{j}\right)\right), \quad j=1,2
$$

For conveninece we will consider the

$$
0<c_{1}<c_{2}
$$

connected component of $\mathbb{R}^{2} \backslash \mathcal{C}$ throughout the paper. Since

$$
\begin{aligned}
& q\left(x, a_{1}, a_{2}, c_{1}, c_{2}\right)=-q\left(x, a_{2}, a_{1}, c_{2}, c_{1}\right) \\
& q\left(x, a_{1}, a_{2},-c_{1},-c_{2}\right)=-q\left(-x,-a_{1},-a_{2}, c_{1}, c_{2}\right)
\end{aligned}
$$

the only other component to consider would be, say, $0<-c_{1}<c_{2}$ (see Fig.2), and the analysis is similar.

We should however mention that in numerical experiments it is more useful to introduce a phase parameter $\epsilon=\left(\epsilon_{1}, \epsilon_{2}\right), \epsilon_{j}= \pm 1$, and define $\tilde{q}(x, a, c, \epsilon)$ by (3.2) but with $\gamma_{j}$ 's replaced by

$$
\tilde{\gamma}_{j}=(-1)^{j-1} \epsilon_{j} \exp \left(-c_{j}\left(x-a_{j}\right)\right), \quad j=1,2 .
$$

We can then check that

$$
\tilde{q}(x, a, c, \epsilon)=q\left(x, a,\left(\epsilon_{1} c_{1}, \epsilon_{2} c_{2}\right)\right),
$$

but $\tilde{q}$ seems more stable in numerical calculations.
The corresponding double-soliton

$$
\begin{equation*}
u(x, t)=q\left(x, a_{1}+c_{1}^{2} t, a_{2}+c_{2}^{2} t, c_{1}, c_{2}\right) \tag{3.3}
\end{equation*}
$$

is an exact solution to mKdV. For the double soliton this can be checked by an explicit calculation but it is a consequence of the inverse scattering method. This is the only place in this paper where we appeal directly to the inverse scattering method. Fig. 4 illustrates some aspects of this evolution.

The scaling properties of mKdV imply that

$$
\begin{gather*}
q(x+t, a+(t, t), c)=q(x, a, c) \\
\quad q(t x, t a, c / t)=q(x, a, c) / t \tag{3.4}
\end{gather*}
$$

Both properties also follow from the formula for $q$, with the second one being slightly less obvious:

$$
\left.\begin{array}{rl}
q(t x, t a, c / t) & =\frac{1}{\operatorname{det} t M} \operatorname{det}\left[\left.\begin{array}{c|c}
t M & \gamma_{1} \\
\hline 1 & 1
\end{array} \right\rvert\,\right. \\
\hline
\end{array}\right] \quad \begin{aligned}
& \gamma_{2} \\
&
\end{aligned}=\frac{1}{\operatorname{det} t M} \operatorname{det}\left(\left[\begin{array}{cc|c}
t & 0 & 0 \\
0 & t & 0 \\
\hline 0 & 0 & 1
\end{array}\right] M_{1}\left[\begin{array}{cc|c}
1 & 0 & 0 \\
0 & 1 & 0 \\
\hline 0 & 0 & 1 / t
\end{array}\right]\right)
$$

Figure 4. A depiction of the double soliton solution given by (3.3). The top figure shows the evolution of a double soliton. The bottom two figures show the evolution of its two components defined using (3.11). One possible "particle-like" interpretation of the two soliton interaction [4] is that the slower soliton, shown in the left bottom plot is hit by the fast soliton shown in the right bottom plot. Just like billiard balls, the slower one picks up speed, and the fast one slows down. But unlike billiard balls, the solitons simply switch velocities.

Now we discuss in more detail the properties of the profile $q$. Recalling that we suppose that $c_{2}>c_{1}>0$, let

$$
\begin{equation*}
\alpha_{1} \stackrel{\text { def }}{=} \frac{1}{c_{1}} \log \left(\frac{c_{1}+c_{2}}{c_{2}-c_{1}}\right), \quad \alpha_{2} \stackrel{\text { def }}{=} \frac{1}{c_{2}} \log \left(\frac{c_{2}-c_{1}}{c_{1}+c_{2}}\right), \tag{3.5}
\end{equation*}
$$

noting that for $c_{2}>c_{1}>0, \alpha_{1}>0$ and $\alpha_{2}<0$. Fix a smooth function, $\theta \in$ $C^{\infty}(\mathbb{R},[0,1])$, such that

$$
\theta(s)=\left\{\begin{align*}
1 & \text { for } \quad s \leq-1  \tag{3.6}\\
-1 & \text { for } s \geq 1
\end{align*}\right.
$$

Figure 5. The top plots show show $q(x, 3,5, \mp 3, \pm 3)$, the corresponding $\eta\left(x, \hat{a}_{j}, c_{j}\right)$ given by Lemma 3.2. The bottom plots show the postinteraction pictures at times $\mp 0.75$. Since the sign of $a_{2}-a_{1}$ changes after the interaction we see the shift compared to the evotion of $\eta\left(x, \hat{a}_{j}, c_{j}\right)$ 's.

Define the shifted positions as

$$
\begin{equation*}
\hat{a}_{j} \stackrel{\text { def }}{=} a_{j}+\alpha_{j} \theta\left(a_{2}-a_{1}\right) \tag{3.7}
\end{equation*}
$$

that is,

$$
\hat{a}_{j}= \begin{cases}a_{j}+\alpha_{j}, & a_{2} \ll a_{1}, \\ a_{j}-\alpha_{j}, & a_{2} \gg a_{1}\end{cases}
$$

see Fig. 5. We note that $\hat{a}_{j}=\hat{a}_{j}\left(a_{j}, c_{1}, c_{2}\right)$.

Let $\mathcal{S}$ denote the Schwartz space. We will next introduce function classes $\mathcal{S}_{\text {sol }}$ and $\mathcal{S}_{\text {err }}$, and then show that $q \in \mathcal{S}_{\text {sol }}$ and give an approximate expression for $q$ with error in $\mathcal{S}_{\text {err }}$.

Definition 3.1. Let $\mathcal{S}_{\text {err }}$ denote the class of functions, $\varphi=\varphi(x, a, c), x \in \mathbb{R}, a \in \mathbb{R}^{2}$, $0<\delta<c_{1}<c_{2}-\delta<1 / \delta$ (for any fixed $\delta$ ) satisfying

$$
\left|\partial_{x}^{\ell} \partial_{c}^{k} \partial_{a}^{p} \varphi\right| \leq C_{2} \exp \left(-\left(\left|x-a_{1}\right|+\left|x-a_{2}\right|\right) / C_{1}\right),
$$

where $C_{j}$ depend on $\delta, \ell, k$, and $p$ only.
Let $\mathcal{S}_{\text {sol }}$ denote the class of functions of ( $x, a, c$ ) of the form

$$
p_{1}\left(c_{1}, c_{2}\right) \varphi_{1}\left(c_{1}\left(x-\hat{a}_{1}\right)\right)+p_{2}\left(c_{1}, c_{2}\right) \varphi_{2}\left(c_{2}\left(x-\hat{a}_{2}\right)\right)+\varphi(x, a, c)
$$

where
(1) $\left|\partial_{k}^{\ell} \varphi_{j}(k)\right| \leq C_{\ell} \exp (-|k| / C)$, for some $C$,
(2) $p_{j} \in C^{\infty}\left(\mathbb{R}^{2} \backslash \mathcal{C}\right)$.
(3) $\varphi \in \mathcal{S}_{\text {err }}$.

Some elementary properties of $\mathcal{S}_{\text {sol }}$ and $\mathcal{S}_{\text {err }}$ are given in the following.
Lemma 3.1 (properties of $\mathcal{S}_{\text {err }}$ ).
(1) $\partial_{x} \mathcal{S}_{\text {err }} \subset \mathcal{S}_{\text {err }}, \partial_{a_{j}} \mathcal{S}_{\text {err }} \subset \mathcal{S}_{\text {err }}, \partial_{c_{j}} \mathcal{S}_{\text {err }} \subset \mathcal{S}_{\text {err }}$.
(2) $\left(x-a_{j}\right) \mathcal{S}_{\text {err }} \subset \mathcal{S}_{\text {err }}$ and $\left(x-\hat{a}_{j}\right) \mathcal{S}_{\text {err }} \subset \mathcal{S}_{\text {err }}$.
(3) If $f \in \mathcal{S}_{\text {err }}$ and $\int_{-\infty}^{+\infty} f=0$, then $\partial_{x}^{-1} f \in \mathcal{S}_{\text {err }}$.

The class $\mathcal{S}_{\text {err }}$ allows to formulate the following
Lemma 3.2 (asymptotics for $q$ ). Suppose that $0<c_{1}<c_{2}<c_{1} / \epsilon<1 / \epsilon^{2}$, for $\epsilon>0$. Then for $\left|a_{2}-a_{1}\right| \geq C_{0} /\left(c_{1}+c_{2}\right)$,

$$
\begin{equation*}
\left|\partial_{x}^{\ell} \partial_{c}^{k} \partial_{a}^{p}\left(q(x, a, c)-\sum_{j=1}^{2} \eta\left(x, \hat{a}_{j}, c_{j}\right)\right)\right| \leq C_{2} \exp \left(-\left(\left|x-a_{1}\right|+\left|x-a_{2}\right|\right) / C_{1}\right) \tag{3.8}
\end{equation*}
$$

where $C_{2}$ depends on $k, \ell, p$ and $\epsilon$, and $C_{0}, C_{1}$ on $\epsilon$ only. In other words,

$$
q(x, a, c)-\sum_{j=1}^{2} \eta\left(x, \hat{a}_{j}, c_{j}\right) \in \mathcal{S}_{\mathrm{err}}
$$

Corollary 3.3. $\partial_{x}^{-1} \partial_{a_{j}} q, \partial_{x}^{-1} \partial_{c_{j}} q \in \mathcal{S}_{\text {sol }}$.
Proof. By Lemma 3.2, we have

$$
\partial_{c_{j}} q=\partial_{c_{j}} \sum_{j=1}^{2} \eta\left(\cdot, \hat{a}_{j}, c_{j}\right)+f
$$

where $f \in \mathcal{S}_{\text {err }}$. By direct computation with the $\eta$ terms, we find that

$$
\int_{-\infty}^{+\infty} \partial_{c_{j}} \sum_{j=1}^{2} \eta\left(\cdot, \hat{a}_{j}, c_{j}\right)=0
$$

By the remark in Lemma 3.5, we have $\int_{-\infty}^{+\infty} \partial_{c_{j}} q=0$. Hence $\int_{-\infty}^{+\infty} f=0$. By Lemma $3.1(3)$, we have $\partial_{x}^{-1} f \in \mathcal{S}_{\text {err }}$. Hence

$$
\partial_{x}^{-1} \partial_{c_{j}} q=\partial_{x}^{-1} \partial_{c_{j}} \sum_{j=1}^{2} \eta\left(\cdot, \hat{a}_{j}, c_{j}\right)+\mathcal{S}_{\mathrm{err}}
$$

and the right side is clearly in $\mathcal{S}_{\text {sol }}$.
Proof of Lemma 3.2. We define

$$
\begin{equation*}
Q(x, \alpha, \delta) \stackrel{\text { def }}{=} q(x,-\alpha, \alpha, 1-\delta, 1+\delta) \tag{3.9}
\end{equation*}
$$

so that, using (3.4),

$$
\begin{gather*}
q\left(x, a_{1}, a_{2}, c_{1}, c_{2}\right)=\frac{c_{1}+c_{2}}{2} Q\left(\left(\frac{c_{1}+c_{2}}{2}\right)\left(x-\frac{a_{1}+a_{2}}{2}\right), \alpha, \delta\right)  \tag{3.10}\\
\alpha=\left(\frac{c_{1}+c_{2}}{2}\right)\left(\frac{a_{2}-a_{1}}{2}\right), \delta=\frac{c_{2}-c_{1}}{c_{2}+c_{1}}
\end{gather*}
$$

Hence it is enough to study the more symmetric expression (3.9). We decompose it in the same spirit as the decomposition of double solitons for KdV was performed in [4]:

$$
\begin{equation*}
Q(x, \alpha, \delta)=\tau(x, \alpha, \delta)+\tau(-x,-\alpha, \delta) \tag{3.11}
\end{equation*}
$$

where

$$
\begin{equation*}
\tau(x, \alpha, \delta)=\frac{1}{2} \frac{(1+\delta) \exp ((1-\delta)(x+\alpha))+(1-\delta) \exp ((1+\delta)(x-\alpha))}{\delta \operatorname{sech}^{2}(x-\delta \alpha)+\delta^{-1} \cosh ^{2}(\delta x-\alpha)} \tag{3.12}
\end{equation*}
$$

This follows from a straightforward but tedious calculation which we omit.
Thus, to show (3.8) we have to show that

$$
\begin{align*}
& \left|\partial_{x}^{\ell} \partial_{\alpha}^{p} \partial_{\delta}^{k}(\tau(x, \alpha, \delta)-\eta(x-|\alpha|-\log (1 / \delta) /(1 \pm \delta), 1 \pm \delta))\right|  \tag{3.13}\\
& \quad \leq C_{2} \exp \left(-(|x|+|\alpha|) / C_{1}\right), \quad \pm \alpha \gg 1
\end{align*}
$$

uniformly for $0<\delta \leq 1-\epsilon$.
To see this put $\gamma=(1-\delta) /(1+\delta)$, and multiply the numerator and denominator of (3.12) by $e^{-(1+\delta)(x-\alpha)}$ :

$$
\begin{equation*}
\tau(x, \alpha, \delta)=\frac{2(1-\delta)\left(1+\gamma^{-1} e^{2 \alpha-2 \delta x}\right)}{\delta e^{(1-\delta)(x+\alpha)}\left(1-e^{-2 x+2 \delta \alpha}\right)^{2}+\delta^{-1} e^{-(1-\delta)(x+\alpha)}\left(1+e^{-2 \delta x+2 \alpha}\right)^{2}} . \tag{3.14}
\end{equation*}
$$

Similarly, the multiplication by $e^{-(1+\delta)(x-\alpha)}$ gives

$$
\begin{align*}
\tau(x, \alpha, \delta)= & \frac{2(1+\delta)\left(1+\gamma e^{-2 \alpha+2 \delta x}\right)}{\delta e^{(1+\delta)(x-\alpha)}\left(1-e^{-2 x+2 \delta \alpha}\right)^{2}+\delta^{-1} e^{-(1+\delta)(x-\alpha)}\left(1+e^{-2 \delta x-2 \alpha}\right)^{2}}  \tag{3.15}\\
& =\frac{2(1+\delta)\left(1+\gamma e^{-2 \alpha+2 \delta x}\right)\left(1+e^{-2 \delta x-2 \alpha}\right)^{-2}}{\delta e^{(1+\delta)(x-\alpha)}\left(\left(1-e^{-2 x+2 \delta \alpha}\right) /\left(1+e^{-2 \delta x-2 \alpha}\right)\right)^{2}+\delta^{-1} e^{-(1+\delta)(x-\alpha)}}
\end{align*}
$$

This shows that for negative values of $x, \tau$ is negligible: multiplying the numerator and denominator by $\delta$ and using (3.14) for $\alpha \leq 0$ and (3.15) for $\alpha \geq 0$, gives

$$
\tau(x, \alpha, \delta) \leq \begin{cases}\delta(1+\delta)\left(1+e^{-2(|\alpha|+\delta|x|)}\right) e^{-(1+\delta)(|x|+|\alpha|)}, & \alpha \geq 0  \tag{3.16}\\ \delta(1+\delta)\left(1+e^{2 \delta|x|-2|\alpha|}\right)^{-1} e^{-(1-\delta)(|x|+|\alpha|)}, & \alpha \leq 0\end{cases}
$$

and in fact this is valid uniformly for $0 \leq \delta \leq 1$. Similar estimates hold also for derivatives.

For $x \geq 0,0 \leq \delta \leq 1-\epsilon$, and for $\alpha \ll-1$, we use (3.14) to obtain,

$$
\tau(x, \alpha, \delta)=(1-\delta) \operatorname{sech}\left((1-\delta)\left(x-|\alpha|-\frac{1}{1-\delta} \log \frac{1}{\delta}\right)\right)+\epsilon_{-}(x, \alpha, \delta)
$$

and for $\alpha \gg 1,(3.15)$ :

$$
\tau(x, \alpha, \delta)=(1+\delta) \operatorname{sech}\left((1+\delta)\left(x-|\alpha|-\frac{1}{1+\delta} \log \frac{1}{\delta}\right)\right)+\epsilon_{+}(x, \alpha, \delta)
$$

where

$$
\left|\partial_{x}^{k} \epsilon_{ \pm}\right| \leq C_{k} \exp (-(|x|+|\alpha|) / c), \quad c>0,
$$

uniformly in $\delta, 0<\delta<1-\epsilon$. Inserting the resulting decomposition into (3.10) completes the proof.

Lemma 3.4 (fundamental identities for $q$ ). With $q=q(\cdot, a, c)$, we have

$$
\begin{gather*}
\partial_{x} I_{3}^{\prime}(q)=2 \partial_{x}\left(-\partial_{x}^{2} q-2 q^{3}\right)=2 \sum_{j=1}^{2} c_{j}^{2} \partial_{a_{j}} q  \tag{3.17}\\
\partial_{x} I_{1}^{\prime}(q)=2 \partial_{x} q=-2 \sum_{j=1}^{2} \partial_{a_{j}} q,  \tag{3.18}\\
q=\sum_{j=1}^{2}\left(x-a_{j}\right) \partial_{a_{j}} q+\sum_{j=1}^{2} c_{j} \partial_{c_{j}} q . \tag{3.19}
\end{gather*}
$$

These three identities are analogues of the following three identities for the singlesoliton $\eta=\eta(\cdot, a, c)$, which are fairly easily verified by direct inspection.

$$
\partial_{x} I_{1}^{\prime}(\eta)=\partial_{x} \eta=-\partial_{a} \eta
$$

$$
\begin{aligned}
\partial_{x} I_{3}^{\prime}(\eta) & =\partial_{x}\left(-\partial_{x}^{2} \eta-2 \eta^{3}\right)=c^{2} \partial_{a} \eta \\
\eta & =(x-a) \partial_{a} \eta+c \partial_{c} \eta
\end{aligned}
$$

Proof. The first identity is just the statement that (3.3) solves mKdV and we take it on faith from the inverse scattering method (or verify it by a computation). To see (3.18) and (3.19) we differentiate (3.4) with respect to $t$.

The value of $I_{j}(q)$ for all $j$ is recorded in the next lemma.
Lemma 3.5 (values of $I_{j}(q)$ ).

$$
\begin{equation*}
I_{0}(q)=2 \pi \tag{3.20}
\end{equation*}
$$

For $j=1,3,5$, we have

$$
\begin{equation*}
I_{j}(q)=2(-1)^{\frac{j-1}{2}} \frac{c_{1}^{j}+c_{2}^{j}}{j} \tag{3.21}
\end{equation*}
$$

Also,

$$
\begin{equation*}
\int x q(x, a, c)^{2} d x=2 a_{1} c_{1}+2 a_{2} c_{2} . \tag{3.22}
\end{equation*}
$$

Note that by (3.20),

$$
\int_{-\infty}^{+\infty} \partial_{a_{j}} q=0, \quad \int_{-\infty}^{+\infty} \partial_{c_{j}} q=0, \quad j=1,2 .
$$

from which it follows that $\partial_{x}^{-1}\left(\partial_{a_{j}} q\right)$ and $\partial_{x}^{-1}\left(\partial_{c_{j}} q\right)$ are Schwartz class functions.
Proof. We prove (3.21), (3.20) by reduction to the 1 -soliton case. Let $u(t)=q\left(\cdot, a_{1}+\right.$ $\left.t c_{1}^{2}, a_{2}+t c_{2}^{2}, c_{1}, c_{2}\right)$. Then by the asymptotics in Lemma 3.2,

$$
I_{j}(q)=I_{j}(u(0))=I_{j}(u(t))=\sum_{k=1}^{2} I_{j}\left(\eta\left(\cdot,\left(a_{k}+c_{k}^{2} t\right)^{\wedge}, c_{k}\right)\right)+\omega(t)
$$

where

$$
|\omega(t)| \lesssim\left\langle c_{2}\left(\left(a_{1}+t c_{1}^{2}\right)-\left(a_{2}+t c_{2}^{2}\right)\right)\right\rangle^{-2}
$$

But note that by scaling,

$$
I_{j}\left(\eta\left(\cdot,\left(a_{k}+c_{k}^{2} t\right)^{\wedge}, c_{k}\right)\right)=c_{k}^{j} I_{j}(\eta)
$$

By sending $t \rightarrow+\infty$, we find that

$$
I_{j}(q)=\left(c_{1}^{j}+c_{2}^{j}\right) I_{j}(\eta)
$$

To compute $I_{j}(\eta)$, we let $\eta_{c}(x)=c \eta(c x)$. By scaling $I_{j}\left(\eta_{c}\right)=c^{j} I_{j}(\eta)$. Hence

$$
\begin{aligned}
j I_{j}(\eta) & =\left.\partial_{c}\right|_{c=1} I_{j}\left(\eta_{c}\right)=\left\langle I_{j}^{\prime}(\eta),\left.\partial_{c}\right|_{c=1} \eta_{c}\right\rangle \\
& =\left\langle I_{j}^{\prime}(\eta),(x \eta)_{x}\right\rangle=2(-1)^{\frac{j-1}{2}}\left\langle\eta,(x \eta)_{x}\right\rangle=2(-1)^{\frac{j-1}{2}}
\end{aligned}
$$

where we have used the identity

$$
\begin{equation*}
I_{j}^{\prime}(\eta)=2(-1)^{\frac{j-1}{2}} \eta \tag{3.23}
\end{equation*}
$$

which follows from the energy hierarchy. In fact, $I_{1}^{\prime}(\eta)=2 \eta$ is just the definition of $I_{1}^{\prime}$. Assuming that $I_{j}^{\prime}(\eta)=2(-1)^{\frac{j-1}{2}} \eta$, we compute

$$
\begin{aligned}
\partial_{x} I_{j+2}^{\prime}(\eta) & =\Lambda(\eta) \partial_{x} I_{j}^{\prime}(\eta) \\
& =2(-1)(-1)^{\frac{j-1}{2}}\left(\partial_{x}^{2}+4 \eta^{2}+4 \eta_{x} \partial_{x}^{-1} \eta\right) \eta_{x} \\
& =2(-1)^{\frac{j+1}{2}} \partial_{x}\left(\eta_{x x}+2 \eta^{3}\right) \\
& =2(-1)^{\frac{j+1}{2}} \partial_{x} \eta
\end{aligned}
$$

We now prove (3.22). By direct computation, if $u(t)$ solves mKdV, then $\partial_{t} \int x u^{2}=$ $-3 I_{3}(u)$. Again let $u(t)=q\left(\cdot, a_{1}+t c_{1}^{2}, a_{2}+t c_{2}^{2}, c_{1}, c_{2}\right)$. By (3.21) with $j=3$, we have

$$
\int x q(x, a, c)^{2} d x=\int x u(0, x)^{2} d x=\int x u(t, x)^{2} d x-2\left(c_{1}^{3}+c_{2}^{3}\right) t
$$

By the asymptotics in Lemma 3.2,

$$
\int x u(t, x)^{2}=\sum_{j=1}^{2} \int x \eta\left(x,\left(a_{j}+t c_{j}^{2}\right)^{\wedge}, c_{j}\right)^{2}+\omega(t)
$$

where

$$
|\omega(t)| \leq\left(a_{1}+t c_{1}^{2}\right)\left\langle c_{2}\left(\left(a_{1}+c_{1}^{2} t\right)-\left(a_{2}+t c_{2}^{2}\right)\right)\right\rangle^{-2}
$$

But

$$
\int x \eta\left(x, \hat{a}_{j}, c_{j}\right)^{2}=2 c_{j} \hat{a}_{j}
$$

Combining, and using that $c_{1} \hat{a}_{1}+c_{2} \hat{a}_{2}=c_{1} a_{1}+c_{2} a_{2}$, we obtain

$$
\int x q(x, a, c)^{2} d x=2\left(c_{1} a_{1}+c_{2} a_{2}\right)+\omega(t)
$$

Send $t \rightarrow+\infty$ to obtain the result.
We define the four-dimensional manifold of 2 -solitons $M$ as

$$
M=\left\{q(\cdot, a, c) \mid a=\left(a_{1}, a_{2}\right) \in \mathbb{R}^{2}, c=\left(c_{1}, c_{2}\right) \in(\mathbb{R})^{2} \backslash \mathcal{C}\right\}
$$

Lemma 3.6. The symplectic form (2.1) restricted to the manifold of 2 -olitons is given by

$$
\left.\omega\right|_{M}=\sum_{j=1}^{2} d a_{j} \wedge d c_{j}
$$

In particular, it is nondegenerate and $M$ is a symplectic manifold.

Proof. By (3.21) with $j=1$ and (3.18),

$$
\begin{aligned}
0 & =\frac{1}{2} \partial_{a_{1}} I_{1}(q)=\frac{1}{2}\left\langle I_{1}^{\prime}(q), \partial_{a_{1}} q\right\rangle=\left\langle\partial_{a_{1}} q, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle+\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle \\
& =\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle
\end{aligned}
$$

Again by (3.21) with $j=1$ and (3.18),

$$
\begin{equation*}
1=\frac{1}{2} \partial_{c_{1}} I_{1}(q)=\frac{1}{2}\left\langle I_{1}^{\prime}(q), \partial_{c_{1}} q\right\rangle=\left\langle\partial_{a_{1}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle+\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle \tag{3.24}
\end{equation*}
$$

By (3.21) with $j=3$ and (3.17),

$$
\begin{equation*}
-c_{1}^{2}=\frac{1}{2} \partial_{c_{1}} I_{3}(q)=\frac{1}{2}\left\langle I_{3}^{\prime}(q), \partial_{c_{1}} q\right\rangle=-c_{1}^{2}\left\langle\partial_{a_{1}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle-c_{2}^{2}\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle \tag{3.25}
\end{equation*}
$$

Solving (3.24) and (3.25), we obtain that $\left\langle\partial_{a_{1}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle=1$ and $\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle=0$. We similarly obtain that $\left\langle\partial_{a_{2}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle=1$ and $\left\langle\partial_{a_{1}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle=0$. It remains to show that $\left\langle\partial_{c_{1}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle=0$ :

$$
\begin{align*}
\left\langle\partial_{c_{1}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle & =\frac{1}{c_{1}}\left\langle\sum_{j=1}^{2} c_{j} \partial_{c_{j}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle \\
& =\frac{1}{c_{1}}\left\langle q-\sum_{j=1}^{2}\left(x-a_{j}\right) \partial_{a_{j}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle  \tag{3.19}\\
& =\frac{1}{c_{1}}\left\langle q+x q_{x}, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle+\frac{1}{c_{1}} \sum_{j=1}^{2} a_{j}\left\langle\partial_{a_{j}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle  \tag{3.18}\\
& =-\frac{1}{2 c_{1}} \partial_{c_{2}} \int x q^{2}+\frac{a_{2}}{c_{1}} \\
& =0 \tag{3.22}
\end{align*}
$$

Remark. If $\left|a_{1}-a_{2}\right| \gg 2$, and $c_{1}<c_{2}$ then, in the notation of (3.7),

$$
\sum_{j=1,2} d a_{j} \wedge d c_{j}=\sum_{j=1,2} d \hat{a}_{j} \wedge d c_{j}
$$

that is the map $(a, c) \mapsto(\hat{a}, c)$ is symplectic.
The nondegeneracy of the symplectic form (2.1) restricted to the manifold of 2olitons, $M$ shows that $H^{2}$ functions close to $M$ can be uniquely decomposed into an element $q$, of $M$ and a function symplectically orthogonal $T_{q} M$. We recall this standard fact in the following

Lemma 3.7 (Symplectic orthogonal decomposition). Given $\tilde{c}$, there exist constants $\delta>0, C>0$ such that the following holds. If $u=q(\cdot, \tilde{a}, \tilde{c})+\tilde{v}$ with $\|\tilde{v}\|_{H^{2}} \leq \delta$, then
there exist unique $a, c$ such that

$$
|a-\tilde{a}| \leq C\|\tilde{v}\|_{H^{2}}, \quad|c-\tilde{c}| \leq C\|\tilde{v}\|_{H^{2}}
$$

and $v \stackrel{\text { def }}{=} u-q(\cdot, a, c)$ satisfies

$$
\begin{equation*}
\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0 \text { and }\left\langle v, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0, j=1,2 . \tag{3.26}
\end{equation*}
$$

Proof. Let $\varphi: H^{2} \times \mathbb{R}^{2} \times\left(\mathbb{R}_{+}\right)^{2} \rightarrow \mathbb{R}^{4}$ be defined by

$$
\varphi(u, a, c)=\left[\begin{array}{c}
\left\langle u-q(\cdot, a, c), \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle \\
\left\langle u-q(\cdot, a, c), \partial_{x}^{-1} \partial_{a_{2}} q\right\rangle \\
\left\langle u-q(\cdot, a, c), \partial_{x}^{-1} \partial_{c_{1}} q\right\rangle \\
\left\langle u-q(\cdot, a, c), \partial_{x}^{-1} \partial_{c_{2}} q\right\rangle
\end{array}\right]
$$

Using that $\left.\omega\right|_{M}=d a_{1} \wedge d c_{1}+d a_{2} \wedge d c_{2}$, we compute the Jacobian matrix of $\varphi$ with respect to $(a, c)$ at $(q(\cdot, \tilde{a}, \tilde{c}), \tilde{a}, \tilde{c})$ to be

$$
D_{a, c} \varphi(q(\cdot \tilde{a}, \tilde{c}), \tilde{a}, \tilde{c})=\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right]
$$

By the implicit function theorem, the equation $\varphi(u, a, c)=0$ can be solved for $(a, c)$ in terms of $u$ in a neighbourhood of $q(\cdot, \tilde{a}, \tilde{c})$.

We also record the following lemma which will be useful in the next section:
Lemma 3.8. Suppose $v$ solves a linearized equation

$$
\partial_{t} v=\frac{1}{2} \partial_{x} I_{3}^{\prime \prime}(q(t)) v=\partial_{x}\left(-\partial_{x}^{2}-6 q(t)^{2}\right) v, \quad q(x, t)=q\left(x, a_{j}+t c_{j}^{2}, c_{j}\right)
$$

Then

$$
\partial_{t}\left\langle v(t), \partial_{x}^{-1}\left(\partial_{c_{j}} q\right)(t)\right\rangle=\partial_{t}\left\langle v(t), \partial_{x}^{-1}\left(\partial_{a_{j}} q\right)(t)\right\rangle=0
$$

where $\left(\partial_{c_{j}} q\right)(t)=\left(\partial_{c_{j}} q\right)\left(x, a_{j}+t c_{j}^{2}, c_{j}\right)$ (and not $\left.\partial_{c_{j}}\left(q\left(x, a_{j}+t c_{j}^{2}, c_{j}\right)\right)\right)$. In addition, for $v(0)=\partial_{a_{j}} q, v(t)=\left(\partial_{a_{j}} q\right)(t)$, and for $v(0)=\partial_{c_{j}} q$,

$$
v(t)=\left(\partial_{c_{j}} q\right)(t)+2 c_{j} t\left(\partial_{a_{j}} q\right)(t) .
$$

## 4. Lyapunov functional and coercivity

In this section we introduce the function $H_{c}$ adapted from the KdV theory of Maddocks-Sachs [24]. We will build our Lyapunov functional $\mathcal{E}$ from $H_{c}$.

Thus let

$$
H_{c}(u) \stackrel{\text { def }}{=} I_{5}(u)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}(u)+c_{1}^{2} c_{2}^{2} I_{1}(u)
$$

We give a direct proof that $q(\cdot, a, c)$ is a critical point of $H_{c}$ :

Lemma 4.1 ( $q$ is a critical point of $H$ ). We have

$$
\begin{equation*}
H_{c}^{\prime}(q(\cdot, a, c))=0 \tag{4.1}
\end{equation*}
$$

that is

$$
I_{5}^{\prime}(q)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}^{\prime}(q)+c_{1}^{2} c_{2}^{2} I_{1}^{\prime}(q)=0
$$

Proof. We follow Lax $[23, \S 2]$ : we want to find $A=A(q)$ and $B=B(q)$ such that

$$
H^{\prime}(q) \stackrel{\text { def }}{=} I_{5}^{\prime}(q)+A I_{3}^{\prime}(q)+B I_{1}^{\prime}(q)=0
$$

for all $q=q(x, a, c) \in M$. If we consider the mKdV evolution of $q$ given by (3.3), then Lemma 3.2 shows that as $t \rightarrow \pm \infty$ we can express $H^{\prime}(q)$ asymptotically using $H^{\prime}\left(\eta_{c_{1}}\right)$ and $H^{\prime}\left(\eta_{c_{2}}\right)$. From (3.23) we see that

$$
H^{\prime}\left(\eta_{c}\right)=I_{5}^{\prime}\left(\eta_{c}\right)+A I_{3}^{\prime}\left(\eta_{c}\right)+B I_{1}^{\prime}\left(\eta_{c}\right)=2\left(c^{4}-A c^{2}+B\right) \eta_{c} .
$$

Two parameters $c_{1}$ and $c_{2}$ are roots of this equation if $A=c_{1}^{2}+c_{2}^{2}$ and $B=c_{1}^{2} c_{2}^{2}$ and this choice gives

$$
\begin{gather*}
H^{\prime}(q(t))=r(t),\|r(t)\|_{L^{2}} \leq C \exp (-|t| / C), \\
q(t) \stackrel{\text { def }}{=} q\left(x, a_{1}+c_{1}^{2} t, a_{2}+c_{2}^{2} t, c_{1}, c_{2}\right), \tag{4.2}
\end{gather*}
$$

where the exponential decay of $r(t)$ comes from Lemma 3.2 and the fact that $c_{1} \neq c_{2}$.
To prove (4.1) we need to show that $r(0) \equiv 0$. For the reader's convenience we provide a direct proof of this widely accepted fact. Since it suffices to prove that $\langle r(0), w\rangle=0$, for all $w \in \mathcal{S}$, we consider the mKdV linearized equation at $q(t)$,

$$
\begin{equation*}
v_{t}=\frac{1}{2} \partial_{x} I_{3}^{\prime \prime}(q(t)) v, \quad v(0)=w \in \mathcal{S} \tag{4.3}
\end{equation*}
$$

and will show that

$$
\begin{equation*}
\partial_{t}\langle r(t), v(t)\rangle=\partial_{t}\left\langle H^{\prime}(q(t)), v(t)\right\rangle=0 \tag{4.4}
\end{equation*}
$$

The conclusion $\langle r(0), w\rangle=0$ will the follow from showing that

$$
\begin{equation*}
\langle r(t), v(t)\rangle \rightarrow 0, \quad t \rightarrow \infty \tag{4.5}
\end{equation*}
$$

We first claim that

$$
\partial_{t}\left\langle I_{k}^{\prime}(q), v\right\rangle=0, \quad \forall k
$$

In fact, from (2.5) we have $\left\langle I_{k}^{\prime}(\varphi), \partial_{x} I_{3}^{\prime}(\varphi)\right\rangle=0$ for all $\varphi \in \mathcal{S}$. Differentiating with respect to $\varphi$ in the direction of $v$, we obtain

$$
\left\langle I_{k}^{\prime \prime}(\varphi) v, \partial_{x} I_{3}^{\prime}(\varphi)\right\rangle=-\left\langle I_{k}^{\prime}(\varphi), \partial_{x} I_{3}^{\prime \prime}(\varphi) v\right\rangle
$$

Applying this with $v=v(t)$ and $\varphi=q(t)$ we conclde that

$$
\begin{aligned}
\partial_{t}\left\langle I_{k}^{\prime}(q), v\right\rangle & =\left\langle I_{k}^{\prime \prime}(q) \partial_{t} q, v\right\rangle+\frac{1}{2}\left\langle I_{k}^{\prime}(q), \partial_{x} I_{3}^{\prime \prime}(q) v\right\rangle \\
& =\frac{1}{2}\left\langle I_{k}^{\prime \prime}(q) \partial_{x} I_{3}^{\prime}(q), v\right\rangle+\frac{1}{2}\left\langle I_{k}^{\prime}(q), \partial_{x} I_{3}^{\prime \prime}(q) v\right\rangle \\
& =0
\end{aligned}
$$

Since $H$ is a linear combination of $I_{k}$ 's, $k=1,3,5$, this gives (4.4).
We now want to use the exponential decay of $\|r(t)\|_{L^{2}}$ in (4.2), and (4.4) to show (4.5). Clearly, all we need is a subexponential estimate on $v(t)$, that is

$$
\begin{equation*}
\forall \epsilon>0 \exists t_{0}, \quad\|v(t)\|_{L^{2}} \leq e^{\epsilon t}, \quad t>t_{0} \tag{4.6}
\end{equation*}
$$

Let $\psi$ be a smooth function such that $\psi(x)=1$ for all $|x| \leq 1$ and $\psi(x) \sim e^{-2|x|}$ for $|x| \geq 1$. With the notation of Lemma 3.2 define

$$
\psi_{j}(x, t)=\psi\left(\delta\left(x-\left(a_{j}+c_{j}^{2} t\right)^{\wedge}\right)\right)
$$

for $0<\delta \ll 1$ to be selected below and $j=1,2$. We now establish that

$$
\begin{equation*}
\left|\partial_{t}\left(\|v\|_{L^{2}}^{2}+\left\|v_{x}\right\|_{L^{2}}^{2}+6 \int q^{2} v^{2}\right)\right| \lesssim \sum_{j=1}^{2}\left\|\psi_{j} v\right\|_{L^{2}}^{2} \tag{4.7}
\end{equation*}
$$

To prove (4.7), apply $\partial_{x}^{-1}$ to (4.3) and pair with $v_{t}$ to obtain

$$
0=\left\langle\partial_{x}^{-1} v_{t}, v_{t}\right\rangle+\left\langle v_{x x}, v_{t}\right\rangle+\left\langle 6 q^{2} v, v_{t}\right\rangle
$$

which implies

$$
\begin{equation*}
\partial_{t}\left(\frac{1}{2}\left\|v_{x}\right\|_{L^{2}}^{2}+3 \int q^{2} v^{2}\right)=6 \int q q_{t} v^{2} \tag{4.8}
\end{equation*}
$$

Next, pair (4.3) with $v$ to obtain

$$
0=\left\langle v_{t}, v\right\rangle+\left\langle v_{x x x}, v\right\rangle+6\left\langle\partial_{x}\left(q^{2} v\right), v\right\rangle
$$

which implies

$$
\begin{equation*}
\partial_{t}\|v\|_{L^{2}}^{2}=-12 \int q q_{x} v^{2} \tag{4.9}
\end{equation*}
$$

Summing (4.8) and (4.9) gives (4.7).
The inequality (4.7) shows that we need to control is $\left\|\psi_{j} v(t)\right\|, j=1,2$. For $t$ large $\psi_{j}$ provides a localization to the region where $q$ decomposes into an approximate sum of decoupled solitons (see Lemma 3.2). Hence we define

$$
\mathcal{L}_{j}=c_{j}^{2}-\partial_{x}^{2}-6 \eta^{2}\left(x,\left(a_{j}+t c_{j}^{2}\right)^{\Upsilon}, c_{j}\right)
$$

(see also $\S 8$ below for a use of similar operators). A calculation shows that

$$
\begin{equation*}
t \geq T(\delta) \Longrightarrow \partial_{t}\left\langle\mathcal{L}_{j} \psi_{j} v, \psi_{j} v\right\rangle=\mathcal{O}(\delta)\|v\|_{H^{1}}^{2} \tag{4.10}
\end{equation*}
$$

where $T(\delta)$ is large enough to ensure that the supports of $\psi_{j}$ 's are separated. It suffices to assume that $v(0)=w$ satisfies $\left\langle w, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0$ and $\left\langle w, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0$, since Lemma 3.8 already showed that the evolutions of $\partial_{a_{j}} q$ and $\partial_{c_{j}} q$ are linearly bounded in $t$. Under this assumption, we have by Lemma 3.8 that $\left\langle v(t), \partial_{x}^{-1} \partial_{a_{j}} q(t)\right\rangle=0$ and $\left\langle v(t), \partial_{x}^{-1} \partial_{c_{j}} q(t)\right\rangle=0$.

We now want to invoke the well known coercivity estimates for operators $\mathcal{L}_{j}$ - see for instance $[18, \S 4]$ for a self contained presentation. For that we need to check that

$$
\left|\left\langle\psi_{j} v, \partial_{x}^{-1} \partial_{a} \eta\left(\hat{a}_{j}+t c_{j}^{2}, c_{j}\right)\right\rangle\right| \ll 1, \quad \mid\left\langle\psi_{j} v, \partial_{x}^{-1}\left(\partial_{c} \eta\left(\hat{a}_{j}+t c_{j}^{2}, c_{j}\right)| \rangle \mid \ll 1 .\right.\right.
$$

This follows from the fact that $v$ is symplectically orthogonal to $\left(\partial_{c_{j}} q\right)(t)$ and $\partial_{a_{j}} q(t)$ (Lemma 3.8 again), the fact that $q$ decouples into two solitons for $t$ large, and from the remark after the proof of Lemma 3.6.

Hence,

$$
\left\langle\mathcal{L}_{j} \psi_{j} v, \psi_{j} v\right\rangle \gtrsim\left\|\psi_{j} v\right\|_{H^{1}}^{2} .
$$

We now sum (4.7) and (4.10) multiplied by $\delta^{-\frac{1}{2}}$ to obtain, for $t$ suffieciently large (depending on $\delta$ ),

$$
\begin{gathered}
F^{\prime}(t) \leq C \delta^{\frac{1}{2}} F(t) \\
F(t) \stackrel{\text { def }}{=}\|v(t)\|_{H^{1}}^{2}+6 \int q^{2}(t) v(t)^{2}+\delta^{-\frac{1}{2}}\left\langle\mathcal{L}_{j}(t) \psi_{j}(t) v(t), \psi_{j}(t) v(t)\right\rangle
\end{gathered}
$$

(where we added the additional $\int q^{2} v^{2}$ term to the right hand side at no cost). Consequently, $F(t) \leq \exp \left(C^{\prime} \delta^{\frac{1}{2}} t\right)$, for $t>T_{1}(\delta)$.

We recall that this implies (4.6) and going back to (4.4) show that $r(0)=0$, and hence $H^{\prime}(q)=0$.

We denote the Hessian of $H_{c}$ at $q(\bullet, a, c)$ by $\mathcal{K}_{c, a}$ :

$$
\mathcal{K}_{c, a}=I_{5}^{\prime \prime}(q)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}^{\prime \prime}(q)+c_{1}^{2} c_{2}^{2} I_{1}^{\prime \prime}(q)
$$

It is a fourth order self-adjoint operator on $L^{2}(\mathbb{R})$ and a calculation shows that

$$
\begin{align*}
\frac{1}{2} \mathcal{K}_{c, a}= & \left(-\partial_{x}^{2}+c_{1}^{2}\right)\left(-\partial_{x}^{2}+c_{2}^{2}\right)  \tag{4.11}\\
& +10 \partial_{x} q^{2} \partial_{x}+10\left(-q_{x}^{2}+\left(q^{2}\right)_{x x}+3 q^{4}\right)-6\left(c_{1}^{2}+c_{2}^{2}\right) q^{2}
\end{align*}
$$

Lemma 4.2 (mapping properties of $\mathcal{K}$ ). The kernel of $\mathcal{K}_{c, a}$ in $L^{2}(\mathbb{R})$ is spanned by $\partial_{a_{j}} q$ :

$$
\begin{equation*}
\mathcal{K}_{c, a} \partial_{a_{j}} q=0 \tag{4.12}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathcal{K}_{c, a} \partial_{c_{j}} q=4(-1)^{j} c_{j}\left(c_{1}^{2}-c_{2}^{2}\right) \partial_{x}^{-1} \partial_{a_{j}} q \tag{4.13}
\end{equation*}
$$

Proof. Equations (4.12) follow from differentiation of (4.1) with respect to $a_{j}$. As $x \rightarrow \infty$, the leading part of $\mathcal{K}_{c, a}$ is given by $\left(-\partial_{x}^{2}+c_{1}^{2}\right)\left(-\partial_{x}^{2}+c_{2}^{2}\right)$ and hence the kernel in $L^{2}$ is at most two dimensional.

To see (4.13) recall that

$$
\begin{gathered}
I_{1}^{\prime}(q)=2 q=-2 \partial_{x}^{-1}\left(\partial_{a_{1}} q+\partial_{a_{2}} q\right) \\
I_{3}^{\prime}(q)=-2 q^{\prime \prime}-4 q^{3}=2 \partial_{x}^{-1}\left(c_{1}^{2} \partial_{a_{1}} q+c_{2}^{2} \partial_{a_{2}} q\right),
\end{gathered}
$$

where we used Lemma 3.4. By differentiating $H^{\prime}(q)=I_{5}^{\prime}(q)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}^{\prime}(q)+$ $c_{1}^{2} c_{2}^{2} I_{1}^{\prime}(q)=0$ with respect to $c_{j}$, we obtain

$$
\begin{equation*}
\mathcal{K}\left(\partial_{c_{1}} q\right)=-2 c_{1}\left(I_{3}^{\prime}(q)+c_{2}^{2} I_{1}^{\prime}(q)\right), \quad \mathcal{K}\left(\partial_{c_{2}} q\right)=-2 c_{2}\left(I_{3}^{\prime}(q)+c_{1}^{2} I_{1}^{\prime}(q)\right) \tag{4.14}
\end{equation*}
$$

Inserting the above formulæ for $I_{1}^{\prime}(q)$ and $I_{2}^{\prime}(q)$ gives (4.13).
The main result of this section is the following coercivity result:
Proposition 4.3 (coercivity of $\mathcal{K}$ ). There exists $\delta=\delta(c)>0$ such that for all $v \in H^{2}$ satisfying the symplectic orthogonality conditions

$$
\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0 \text { and }\left\langle v, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0, j=1,2,
$$

we have

$$
\begin{equation*}
\delta\|v\|_{H^{2}}^{2} \leq\left\langle\mathcal{K}_{c, a} v, v\right\rangle . \tag{4.15}
\end{equation*}
$$

The proposition is proved in a few steps. In Lemma 4.2 we already described the kernel $\mathcal{K}_{c, a}$ and now we investigate the negative eigenvalues:

Proposition 4.4 (Spectrum of $\mathcal{K}$ ). The operator $\mathcal{K}_{c, a}$ has a single negative eigenvalue, $h \in L^{2}(\mathbb{R})$ :

$$
\begin{equation*}
\mathcal{K}_{c, a} h=-\mu h, \quad \mu>0 . \tag{4.16}
\end{equation*}
$$

In addition, for

$$
0<\delta<c_{1}<c_{2}-\delta<1 / \delta
$$

there exists a constant, $\rho$, depending only on $\delta$, such that

$$
\begin{equation*}
\min \left\{\lambda>0: \lambda \in \sigma\left(\mathcal{K}_{c, a}\right)\right\}>\rho, \quad a \in \mathbb{R}^{2}, \tag{4.17}
\end{equation*}
$$

Proof. As always we assume $0<c_{1}<c_{2}$. We know the continuous spectrum of $\mathcal{K}_{c, a}$,

$$
\sigma_{\mathrm{ac}}\left(\mathcal{K}_{c, a}\right)=\left[2 c_{1}^{2} c_{2}^{2},+\infty\right)
$$

and that for all $a, c$, there is a two-dimensional kernel given by $\operatorname{span}\left\{\partial_{a_{1}} q, \partial_{a_{2}} q\right\}$. The eigenvalues depend continuously on $a, c$, and hence the constant dimension of the kernel shows that the number of negative eigenvalues is constant (since the creation or annihilation of a negative eigenvalue would increase the dimension of $\operatorname{ker} \mathcal{K}_{c, a}$.)

Hence it suffices to determine the number of negative eigenvalues of $\mathcal{K}$ for any convenient values of $a, c$. To do that we use the following fact:

Lemma 4.5 (Maddocks-Sachs [24, Lemma 2.2]). Suppose that $\mathcal{K}$ is a self-adjoint, 4 th order operator of the form

$$
\mathcal{K}=2\left(-\partial_{x}^{2}+c_{1}^{2}\right)\left(-\partial_{x}^{2}+c_{2}^{2}\right)+p_{0}(x)-\partial_{x} p_{1}(x) \partial_{x},
$$

where the coefficients $p_{j}(x)$ are smooth, real, and rapidly decaying as $x \rightarrow \pm \infty$. Let $r_{1}(x), r_{2}(x)$ be two linearly independent solutions of $\mathcal{K} r_{j}=0$ such that $r_{j} \rightarrow 0$ as $x \rightarrow-\infty$.

Then the number of negative eigenvalues of $\mathcal{K}$ is equal to

$$
\sum_{x \in \mathbb{R}} \operatorname{dim} \operatorname{ker}\left[\begin{array}{ll}
r_{1}(x) & r_{1}^{\prime}(x)  \tag{4.18}\\
r_{2}(x) & r_{2}^{\prime}(x)
\end{array}\right]
$$

We apply this lemma with $\mathcal{K}=\mathcal{K}_{c, a}$, in which case

$$
p_{1}=20 q^{2}, \quad p_{0}=40 q_{x x} q+20 q_{x}^{2}+60 q^{4}-12\left(c_{1}^{2}+c_{2}^{2}\right) q^{2}, \quad q=q(\bullet, a, c) .
$$

Convenient values of $a$ and $c$ are provided by $a_{1}=a_{2}=0$ and $c_{1}=0.5, c_{2}=1.5$. In the notation of (3.9) we then have $q(x, a, c)=Q(x, 0,0.5)$, and since

$$
\partial_{x} Q=-\partial_{a_{1}} q-\partial_{a_{2}} q, \quad \partial_{\alpha} Q=-\partial_{a_{1}} q+\partial_{a_{2}} q
$$

we can take $r_{1}=\partial_{x} Q$ and $r_{2}=\partial_{\alpha} Q$. A computation based on (3.11) and (3.12) shows that

$$
\begin{align*}
Q(x, 0.5,0) & =\operatorname{sech}(x / 2), \quad \partial_{x} Q(x, 0.5,0)=-\frac{\sinh (x / 2)}{2 \cosh ^{2}(x / 2)} \\
\partial_{\alpha} Q(x, 0.5,0) & =\frac{\sinh (x / 2)}{4 \cosh ^{4}(x / 2)}\left(9-2 \cosh ^{2}(x / 2)\right)  \tag{4.19}\\
& =\frac{9 \sinh ^{2}(x / 2)}{4 \cosh ^{4}(x / 2)}+\partial_{x} Q(x, 0.5,0)
\end{align*}
$$

Since $x \mapsto y=\sinh (x / 2)$ is invertible, we only need to check the dimension of the kernel the Wronskian matrix of

$$
\tilde{r}_{1}(y)=\frac{y}{1+y^{2}}, \quad \tilde{r}_{2}(y)=\frac{y}{\left(1+y^{2}\right)^{2}},
$$

and that is equal to 1 at $y=0$ and 0 on $\mathbb{R} \backslash\{0\}$. In view of (4.18) this completes the proof of (4.16)

To prove (4.17) we first note that by rescaling (3.10) we only need to prove the estimate for

$$
K(c, \alpha) \stackrel{\text { def }}{=} \mathcal{K}_{((c, 1),(-\alpha, \alpha))}, \quad c \in[\delta, 1-\delta], \quad 0<\delta<1 / 2
$$

For that we introduce another operator

$$
\begin{equation*}
P(c) \stackrel{\text { def }}{=}\left(-\partial_{x}^{2}+1\right)\left(-\partial_{x}^{2}+c^{2}\right)+10 \partial_{x} \eta^{2} \partial_{x}+10\left(3 \eta^{2}-2 \eta^{4}\right)-6\left(1+c^{2}\right) \eta^{2} \tag{4.20}
\end{equation*}
$$

where

$$
\eta=\operatorname{sech} x, \quad c \in \mathbb{R}_{+} \backslash\{1\} .
$$

The operator $P(c)$ is the Hessian of $H_{(c, 1)}$ at $\eta$, which is also a critical point for $H_{(c, 1)}$. In particular,

$$
P(c) \partial_{x} \eta=0
$$

Putting,

$$
\left.U_{\alpha} f(x) \stackrel{\text { def }}{=} f(x+\alpha+\log ((1+c) /(1-c)))\right)
$$

and

$$
P_{+}(c, \alpha) \stackrel{\text { def }}{=} U_{\alpha}^{*} P(c) U_{\alpha}
$$

we see that

$$
K(c, \alpha)=2 P_{+}(c, \alpha)+\mathcal{O}\left(e^{-(\alpha+|x|) / C}\right) \partial_{x}^{2}+\mathcal{O}\left(e^{-(\alpha+|x|) / C}\right), \quad x \geq 0
$$

Similarly, if

$$
T_{c} f(x) \stackrel{\text { def }}{=} \sqrt{c} f(c x)
$$

and

$$
P_{-}(c, \alpha) \stackrel{\text { def }}{=} c^{2} U_{\alpha} T_{c} P(1 / c) T_{c}^{*} U_{\alpha}^{*},
$$

then

$$
K(c, \alpha)=2 P_{-}(c, \alpha)+\mathcal{O}\left(e^{-(\alpha+|x|) / C}\right) \partial_{x}^{2}+\mathcal{O}\left(e^{-(\alpha+|x|) / C}\right), \quad x \leq 0
$$

We reduce the estimate (4.17) to a spectral fact about the operators $P(c)$ and $P(1 / c)$ :

Lemma 4.6. Suppose that there exists

$$
\alpha \longmapsto \lambda(c, \alpha) \in \mathbb{R} \backslash\{0\}
$$

such that

$$
\lambda(c, \alpha) \in \sigma(K(c, \alpha)), \quad \lambda(c, \alpha) \longrightarrow 0, \alpha \longrightarrow \infty
$$

Then we have

$$
\begin{equation*}
\operatorname{dim} \operatorname{ker}_{L^{2}} P(c)+\operatorname{dim} \operatorname{ker}_{L^{2}} P(1 / c)>2 \tag{4.21}
\end{equation*}
$$

where $\operatorname{ker}_{L^{2}}$ means the kernel in $L^{2}$.
Proof. The assumption that $0 \neq \lambda(c, \alpha) \rightarrow 0$ as $\alpha \rightarrow \infty$ implies that there exists a family of quasimodes $f_{\alpha},\left\|f_{\alpha}\right\|_{L^{2}}=1$,

$$
\begin{equation*}
\left\|K(c, \alpha) f_{\alpha}\right\|_{L^{2}}=o(1), \quad \alpha \longrightarrow \infty, \quad f_{\alpha} \perp \operatorname{ker}_{L^{2}} K(c, \alpha) \tag{4.22}
\end{equation*}
$$

Since we know that the kernel of $K(c, \alpha)$ is spanned by $U_{\alpha}^{*} \partial_{x} \eta+\mathcal{O}\left(e^{-(|x|+\alpha) / C}\right)$ and $U_{\alpha} T_{c} \partial_{x} \eta+\mathcal{O}\left(e^{-(|x|+\alpha) / C}\right)$, we can modify $f_{\alpha}$ and replace the orthogonality condition by

$$
f_{\alpha} \perp \operatorname{span}\left(U_{\alpha}^{*} \partial_{x} \eta, U_{\alpha} T_{c} \partial_{x} \eta\right)
$$

The estimate in (4.22), and $\left\|f_{\alpha}\right\|_{L^{2}}=\mathcal{O}(1)$, imply that

$$
\begin{equation*}
\left\|f_{\alpha}\right\|_{H^{2}}=\mathcal{O}(1), \quad \alpha \longrightarrow \infty \tag{4.23}
\end{equation*}
$$

We first claim that

$$
\begin{equation*}
\int_{-1}^{1}\left|f_{\alpha}(x)\right|^{2} d x=o(1), \quad \alpha \longrightarrow \infty \tag{4.24}
\end{equation*}
$$

In fact, on $[-\alpha / 2, \alpha / 2]$,

$$
K(c, \alpha)=\left(-\partial_{x}^{2}+c^{2}\right)\left(-\partial_{x}^{2}+1\right)+\mathcal{O}\left(e^{-\alpha / C}\right) \partial_{x}^{2}+\mathcal{O}\left(e^{-\alpha / c}\right)
$$

and hence, using (4.23),

$$
\left(-\partial_{x}^{2}+c^{2}\right)\left(-\partial_{x}^{2}+1\right) f_{\alpha}=r_{\alpha}, \quad\left\|r_{\alpha}\right\|_{L^{2}([-\alpha / 2, \alpha / 2])}=o(1)
$$

Putting

$$
e_{\alpha} \stackrel{\text { def }}{=}\left[\left(-\partial_{x}^{2}+c^{2}\right)\left(-\partial_{x}^{2}+1\right)\right]^{-1}\left(r_{\alpha} \mathbb{1}_{[-\alpha / 2, \alpha / 2]}\right), \quad\left\|e_{\alpha}\right\|_{H^{2}}=o(1)
$$

we see that $f_{\alpha}=g_{\alpha}+e_{\alpha}$ where

$$
\begin{equation*}
\left(-\partial_{x}^{2}+c^{2}\right)\left(-\partial_{x}^{2}+1\right) g_{\alpha}(x)=0, \quad|x|<\alpha / 2 \tag{4.25}
\end{equation*}
$$

Suppose now that (4.24) were not valid. Then the same would be true for $g_{\alpha}$, and there would exist a constant $c_{0}>0$, and a sequence $\alpha_{j} \rightarrow \infty$, for which $\left\|g_{\alpha_{j}}\right\|_{L^{2}([-1,1])}>c_{0}$. In view of (4.25) this implies that

$$
g_{\alpha_{j}}(x)=\sum_{ \pm}\left(a_{j}^{ \pm} e^{ \pm x}+b_{j}^{ \pm} e^{ \pm c x}\right), \quad|x|<\alpha / 2, \quad\left|a_{j}^{ \pm}\right|,\left|b_{j}^{ \pm}\right|=\mathcal{O}(1)
$$

and for at least one choice of sign,

$$
\left|a_{j}^{ \pm}\right|^{2}+\left|b_{j}^{ \pm}\right|^{2}>c_{1}>0
$$

We can choose a subsequence so that this is true for a fixed sign, say, + , for all $j$. In that case, a simple calculation shows that for $M_{j} \rightarrow \infty, M_{j} \leq \alpha_{j} / 2$,

$$
\begin{aligned}
\int_{0}^{M_{j}}\left|g_{\alpha_{j}}(x)\right|^{2} d x \geq & \frac{1}{2}\left|a_{j}^{+}\right|^{2} e^{2 M_{j}}+\frac{1}{2 c}\left|b_{j}^{+}\right|^{2} e^{2 c M_{j}}-\frac{2}{c+1}\left|a_{j}^{+}\right|\left|b_{j}^{+}\right| e^{(c+1) M_{j}} \\
& -\frac{2}{1-c}\left|a_{j}^{+}\right|\left|b_{j}^{-}\right| e^{(1-c) M_{j}}-\mathcal{O}(1) \\
\geq & \frac{1}{2}\left(\frac{1-c}{1+c}\right)^{2}\left(\left|a_{j}^{+}\right|^{2} e^{2 M_{j}}+\frac{1}{c}\left|b_{j}^{+}\right|^{2} e^{2 M_{j} c}\right) \\
& -\frac{4}{(1-c)^{2}}\left|a_{j}^{+}\right|^{2} e^{2(1-c) M_{j}}-\mathcal{O}(1)
\end{aligned}
$$

where we used the fact that $0<\delta<c<1-\delta$. Hence

$$
\begin{aligned}
\left\|f_{\alpha_{j}}\right\|_{L^{2}} & \geq \int_{0}^{M_{j}}\left|f_{\alpha_{j}}(x)\right|^{2} d x \geq \int_{0}^{M_{j}}\left|g_{\alpha_{j}}(x)\right|^{2} d x-o(1) \\
& \geq \frac{1}{2}\left(\frac{1-c}{1+c}\right)^{2} c_{1} e^{2 M_{j} c}-\mathcal{O}(1) \longrightarrow \infty, \quad j \rightarrow \infty
\end{aligned}
$$

Since $\left\|f_{\alpha}\right\|_{L^{2}}=1$ we obtain a contradiction proving (4.24).

Now let $\chi_{ \pm} C^{\infty}(\mathbb{R})$ be supported in $\pm[-1, \infty)$, and satisfy $\chi_{+}^{2}+\chi_{-}^{2}=1$. Then (4.24) (and the corresponding estimates for derivatives obtained from (4.22)) shows that

$$
\left\|P_{ \pm}(c, \alpha)\left(\chi_{ \pm} f_{\alpha}\right)\right\|_{L^{2}}=o(1), \quad \alpha \longrightarrow \infty
$$

For at least one of the signs we must have $\left\|\chi_{ \pm} f_{\alpha}\right\|_{L^{2}}>1 / 3$ (if $\alpha$ is large enough), and hence we obtain a quasimode for $P_{ \pm}(c, \alpha)$, orthogonal to the known element of the kernel of $P_{ \pm}(c, \alpha)$. This means that $P_{ \pm}(c, \alpha)$, for at least one of the signs has an additional eigenvalue approaching 0 as $\alpha \rightarrow \infty$. Since the spectrum of $P_{ \pm}(c, \alpha)$ is independent of $\alpha$ it follows that for at least one sign the kernel is two dimensional. This proves (4.21).

The next lemma shows that (4.21) is impossible:
Lemma 4.7. For $c \in \mathbb{R}_{+} \backslash\{1\}$

$$
\begin{equation*}
\operatorname{ker}_{L^{2}} P(c)=\mathbb{C} \cdot \partial_{x} \eta \tag{4.26}
\end{equation*}
$$

Proof. Let $\mathcal{L} \stackrel{\text { def }}{=}\left(I_{3}^{\prime \prime}(\eta)+I_{1}^{\prime \prime}(\eta)\right) / 2$ :

$$
\mathcal{L} v=-v_{x x}-6 \eta^{2} v+v, \quad \eta(x)=\operatorname{sech}(x)
$$

We recall (see the comment after (4.20)) that

$$
P(c)=\frac{1}{2} H_{(c, 1)}^{\prime \prime}(\eta)=\frac{1}{2}\left(I_{5}^{\prime \prime}(\eta)+\left(1+c^{2}\right) I_{3}^{\prime \prime}(\eta)+c^{2} I_{1}^{\prime \prime}(\eta)\right)
$$

We already noted that

$$
\mathcal{L}\left(\partial_{x} \eta\right)=P(c) \partial_{x} \eta=0
$$

and proceeding as in (4.14) we also have

$$
\begin{equation*}
\mathcal{L}\left(\partial_{x}(x \eta)\right)=-2 \eta, \quad P(c)\left(\partial_{x}(x \eta)\right)=2\left(1-c^{2}\right) \eta \tag{4.27}
\end{equation*}
$$

We claim that

$$
\begin{equation*}
P(c) \partial_{x} \mathcal{L}=\mathcal{L} \partial_{x} P(c) \tag{4.28}
\end{equation*}
$$

Since $I_{j}^{\prime}(\eta+t v)=t I_{j}^{\prime \prime}(\eta) v+\mathcal{O}\left(t^{2}\right), v \in \mathcal{S}$, the equation (2.5) implies that

$$
\left\langle I_{j}^{\prime \prime}(\eta) v, \partial_{x} I_{k}^{\prime \prime}(\eta) v\right\rangle=0, \quad \forall j, k, \quad v \in \mathcal{S} .
$$

From this we see that

$$
\left\langle P(c) v, \partial_{x} \mathcal{L} v\right\rangle=0, \quad \forall v \in \mathcal{S}
$$

and hence by polarization,

$$
\left\langle P(c) v, \partial_{x} \mathcal{L} w\right\rangle=-\left\langle P(c) w, \partial_{x} \mathcal{L} v\right\rangle=\left\langle\partial_{x} P(c) w, \mathcal{L} v\right\rangle
$$

which implies (4.28).
Suppose now that $\operatorname{dim} \operatorname{ker}_{L^{2}} P(c)=2$ for some $c \neq 1$, and let $\eta_{x}$ and $\psi$ be the basis of this kernel. Since $P(c)$ is symmetric with respect to the reflection $x \mapsto-x, \psi$ can
be chosen to be either even or odd. Applying (4.28) to $\psi$ we get $P(c) \partial_{x} \mathcal{L} \psi=0$ and hence

$$
\partial_{x} \mathcal{L} \psi=\alpha \eta_{x}+\beta \psi,
$$

for some $\alpha, \beta \in \mathbb{R}$.
If $\psi$ is odd then $\partial_{x} \mathcal{L} \psi$ is even, and therefore $\alpha=\beta=0$. But then $\psi \in \operatorname{ker}_{L^{2}} \mathcal{L}=$ $\mathbb{C} \cdot \eta_{x}$, giving a contradiction.

If $\psi$ is even then $\partial_{x} \mathcal{L} \psi$ is odd, $\beta=0$ and $\mathcal{L} \psi=\alpha \eta$. We have $\alpha \neq 0$ since $\psi$ is orthogonal to the kernel of $\mathcal{L}$, spanned by $\partial_{x} \eta$. From (4.27) we obtain

$$
\psi=-\frac{\alpha}{2} \partial_{x}(x \eta)
$$

Applying the second equation in (4.27) we then obtain

$$
P(c) \psi=-\alpha\left(1-c^{2}\right) \eta
$$

contradicting $\psi \in \operatorname{ker}_{L^{2}} P(c)$.
With this lemma we complete the proof of Proposition 4.4.
To obtain the coercivity statement in Proposition 4.3 we first obtain coercivity under a different orthogonality condition:

Lemma 4.8. There exists a constant $\rho>0$ depending only on $c_{1}, c_{2}$, such that the following holds: If $\left\langle u, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle=0,\left\langle u, \partial_{x}^{-1} \partial_{a_{2}} q\right\rangle=0,\left\langle u, \partial_{a_{1}} q\right\rangle=0,\left\langle u, \partial_{a_{2}} q\right\rangle=0$, then $\left\langle\mathcal{K}_{c, a} u, u\right\rangle \geq \rho\|u\|_{L^{2}}^{2}$.

Proof. To simplify notation we put $\mathcal{K}=\mathcal{K}_{c, a}$ in the proof. Using (4.13) and the expression for the symplectic form, $\left.\omega\right|_{M}=d a_{1} \wedge d c_{1}+d a_{2} \wedge d c_{2}$, we have

$$
\left\langle\mathcal{K} \partial_{c_{1}} q, \partial_{c_{1}} q\right\rangle=-4 c_{1}\left(c_{1}^{2}-c_{2}^{2}\right)\left\langle\partial_{x}^{-1} \partial_{a_{1}} q, \partial_{c_{1}} q\right\rangle=4 c_{1}\left(c_{1}^{2}-c_{2}^{2}\right)
$$

and similarly

$$
\begin{equation*}
\left\langle\mathcal{K} \partial_{c_{2}} q, \partial_{c_{2}} q\right\rangle=-4 c_{2}\left(c_{1}^{2}-c_{2}^{2}\right) . \tag{4.29}
\end{equation*}
$$

Since we assumed that $c_{1}<c_{2},\left\langle\mathcal{K} \partial_{c_{1}} q, \partial_{c_{1}} q\right\rangle<0$.
Let $\widetilde{\partial_{c_{1}} q}$ be the orthogonal projection of $\partial_{c_{1}} q$ on $(\operatorname{ker} \mathcal{K})^{\perp}$. We first claim that there exists a constant $\alpha$ such that $u=\tilde{u}+\alpha \widetilde{\partial_{c_{1}} q}$ with $\langle\tilde{u}, h\rangle=0$, where $\mu$ and $h$ are defined in Proposition 4.4.

To prove this, decompose $\partial_{c_{1}} q$ as $\partial_{c_{1}} q=\xi+\beta h$ with $\langle\xi, h\rangle=0$. Then by (4.29)

$$
\begin{aligned}
0 & >\left\langle\mathcal{K} \partial_{c_{1}} q, \partial_{c_{1}} q\right\rangle \\
& =\langle\mathcal{K} \xi, \xi\rangle+2 \beta\langle\mathcal{K} h, \xi\rangle+\beta^{2}\langle\mathcal{K} h, h\rangle \\
& =\langle\mathcal{K} \xi, \xi\rangle-\mu \beta^{2}
\end{aligned}
$$

Since $\langle\mathcal{K} \xi, \xi\rangle \geq 0$, we must have that $\beta \neq 0$. Hence there exists $u^{\prime}$ and $\alpha$ such that $u=u^{\prime}+\alpha \partial_{c_{1}} q$ with $\left\langle u^{\prime}, h\right\rangle=0$. Now take $\tilde{u}$ to be the projection of $u^{\prime}$ away from the kernel of $\mathcal{K}$. This completes the proof of the claim.

We have that

$$
\left\langle u, \mathcal{K} \partial_{c_{1}} q\right\rangle=-4 c_{1}\left(c_{2}^{2}-c_{1}^{2}\right)\left\langle u, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle=0
$$

by (4.13) and hypothesis. Substituting $u=\tilde{u}+\alpha \widetilde{\partial_{c_{1}} q}$, we obtain

$$
\begin{equation*}
\left\langle\tilde{u}, \mathcal{K} \partial_{c_{1}} q\right\rangle=-\alpha\left\langle\widetilde{\partial_{c_{1}} q}, \mathcal{K} \partial_{c_{1}} q\right\rangle=-\alpha\left\langle\partial_{c_{1}} q, \mathcal{K} \partial_{c_{1}} q\right\rangle \tag{4.30}
\end{equation*}
$$

Now let $\tilde{\rho}$ denote the bottom of the positive spectrum of $\mathcal{K}$. We have

$$
\begin{align*}
\langle\mathcal{K} u, u\rangle & =\left\langle\mathcal{K}\left(\tilde{u}+\alpha \widetilde{\partial_{c_{1}} q}\right),\left(\tilde{u}+\alpha \widetilde{\partial_{c_{1}} q}\right)\right\rangle \\
& =\langle\mathcal{K} \tilde{u}, \tilde{u}\rangle+2 \alpha\left\langle\mathcal{K} \tilde{u}, \partial_{c_{1}} q\right\rangle+\alpha^{2}\left\langle\mathcal{K} \partial_{c_{1}} q, \partial_{c_{1}} q\right\rangle \\
& =\langle\mathcal{K} \tilde{u}, \tilde{u}\rangle-\alpha^{2}\left\langle\mathcal{K} \partial_{c_{1}} q, \partial_{c_{1}} q\right\rangle  \tag{4.30}\\
& \geq \tilde{\rho}\|\tilde{u}\|_{L^{2}}^{2}+4 c_{1}\left(c_{2}^{2}-c_{1}^{2}\right) \alpha^{2} \\
& \geq \tilde{C}\left(\|\tilde{u}\|_{L^{2}}^{2}+\alpha^{2}\right)
\end{align*}
$$

where $\tilde{C}$ depends on $c_{1}, c_{2}$ and $\tilde{\rho}$. However, since $u=\tilde{u}+\alpha \widetilde{\partial_{c_{1}} q}$, we have

$$
\|u\|_{L^{2}}^{2} \leq C\left(\|\tilde{u}\|_{L^{2}}^{2}+\alpha^{2}\right)
$$

where $C$ depends on $c_{1}, c_{2}$ which completes the proof.
We now put

$$
\begin{align*}
& E=E_{a, c}=\operatorname{ker} \mathcal{K}=\operatorname{span}\left\{\partial_{a_{1}} q, \partial_{a_{2}} q\right\} \\
& F=F_{a, c}=\operatorname{span}\left\{\partial_{x}^{-1} \partial_{c_{1}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\}  \tag{4.31}\\
& G=G_{a, c}=\operatorname{span}\left\{\partial_{x}^{-1} \partial_{a_{1}} q, \partial_{x}^{-1} \partial_{a_{2}} q\right\}
\end{align*}
$$

In this notation Lemma 4.8 states that

$$
u \perp(E+G) \Longrightarrow\langle\mathcal{K} u, u\rangle \geq \theta\|u\|_{L^{2}}^{2}
$$

while to establish Proposition 4.3 we need

$$
u \perp(F+G) \Longrightarrow\langle\mathcal{K} u, u\rangle \geq \tilde{\theta}\|u\|_{L^{2}}^{2}
$$

That is, we would like to replace orthogonality with the kernel $E$ by orthogonality with a "nearby" subspace $F$. For this, we apply the following analysis with $D=F^{\perp}$.

Definition 4.1. Suppose that $D$ and $E$ are two closed subspaces in a Hilbert space. Then $\alpha(D, E)$, the angle between $D$ and $E$, is

$$
\alpha(D, E) \stackrel{\text { def }}{=} \cos ^{-1} \sup _{\substack{\|d\|=1, d \in D \\\|e\|=1, e \in E}}\langle d, e\rangle
$$

It is clear that $0 \leq \alpha(D, E) \leq \pi / 2, \alpha(D, E)=\alpha(E, D)$, and that $\alpha(E, D)=\pi / 2$ if and only if $E \perp D$. We will need slightly more subtle properties stated in the following

Lemma 4.9. Suppose that $D$ and $E$ are two closed subspaces in a Hilbert space. Then

$$
\begin{equation*}
\alpha(D, E)=\cos ^{-1} \sup _{\|d\|=1, d \in D}\left\|P_{E} d\right\|, \quad \alpha(D, E)=\sin ^{-1} \inf _{\|d\|=1, d \in D}\left\|P_{E^{\perp}} d\right\| \tag{4.32}
\end{equation*}
$$

In addition if $E$ is finite dimensional then

$$
\begin{equation*}
\alpha(D, E)=0 \Longleftrightarrow D \cap E \neq\{0\} . \tag{4.33}
\end{equation*}
$$

Proof. To see (4.32) let $d \in D$, with $\|d\|=1$. By the definition of the projection operator,

$$
\begin{aligned}
1-\left\|P_{E} d\right\|^{2} & =\left\|d-P_{E} d\right\|^{2}=\inf _{e \in E}\|d-e\|^{2}=\inf _{\substack{e \in E \\
\|e\|=1}} \inf _{\alpha \in \mathbb{R}}\|d-\alpha e\|^{2} \\
& =\inf _{\substack{e \in E \\
\|e\|=1}} \inf _{\alpha \in \mathbb{R}}\left(1-2 \alpha\langle d, e\rangle+\alpha^{2}\right)=\inf _{\substack{e \in E \\
\|e\|=1}}\left(1-\langle d, e\rangle^{2}\right) \\
& =1-\sup _{\substack{e \in E \\
\|e\|=1}}\langle d, e\rangle^{2}
\end{aligned}
$$

and consequently,

$$
\left\|P_{E} d\right\|=\sup _{\substack{e \in E \\\|e\|=1}}\langle d, e\rangle,
$$

from which the first formula in (4.32) follows. The second one is a consequence of the first one as $1=\left\|P_{E} d\right\|^{2}+\left\|P_{E^{\perp}} d\right\|^{2}$.

The $\Leftarrow$ implication in (4.33) is clear. To see the other implication, we observe that if $D \cap E=\{0\}$ and $E$ is finite dimensional then

$$
\inf _{\substack{y \in E \\\|y\|=1}} d(y, D)>0
$$

where $d(y, D)=\inf _{z \in D}\|y-z\|$ is the distance from $y$ to $D$. This implies that

$$
\begin{aligned}
0 & <\inf _{\substack{y \in E \\
\|y\|=1}} \inf _{z \in D}\|y-z\|^{2}=\inf _{\substack{y \in E \\
\|y\|=1}} \inf _{z \in D}\left(1-2\langle y, z\rangle+\|z\|^{2}\right) \\
& \leq \inf _{\substack{y \in E \\
\|y\|=1}} \inf _{\substack{z \in D \\
\|z\|=1}}(2-2\langle y, z\rangle)=2\left(1-\sup _{\substack{y \in E \\
\|y\|=1\\
}} \sup _{\substack{z \in D \\
\|z\|=1}}\langle y, z\rangle\right) \\
& =2(1-\cos \alpha(D, E)) .
\end{aligned}
$$

Thus if $D \cap E=\{0\}$ then $\alpha(D, E)>0$. But that is the $\Rightarrow$ implication in (4.33).
In the notation of (4.31), the translation symmetry gives

$$
\alpha\left(E_{a, c}, F_{a, c}^{\perp}\right)=F\left(c_{1}, c_{2}, a_{1}-a_{2}\right),
$$

where $F$ is a continuous fuction in $\mathcal{C} \times \mathbb{R}$. We claim that

$$
\begin{equation*}
F\left(c_{1}, c_{2}, \alpha\right) \geq \kappa_{\delta}>0 \text { for } \delta \leq c_{1} \leq c_{1}+\delta \leq c_{2} \leq \delta^{-1} \tag{4.34}
\end{equation*}
$$

Consider now the case $\left|a_{1}-a_{2}\right| \leq A$ (where $A$ is chosen large below), and hence $c_{1}$, $c_{2}$, and $a_{1}-a_{2}$ vary within a compact set. Thus it suffices to check that $\alpha\left(E_{a, c}, F_{a, c}^{\perp}\right)$ is nowhere zero and this amounts to checking $E \cap F^{\perp}=\{0\}$.

Suppose the contrary, that is that there exists

$$
u=z_{1} \partial_{a_{1}} q+z_{2} \partial_{a_{2}} q \in F^{\perp} .
$$

Since $\left.\omega\right|_{M}=d a_{1} \wedge d c_{1}+d a_{2} \wedge d c_{2}$,

$$
z_{j}=\left\langle u, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0
$$

This proves (4.34). To complete the argument in the case $\left|a_{1}-a_{2}\right| \leq A$, we need:
Lemma 4.10. Let $E=\operatorname{ker} \mathcal{K}$, and suppose that $G$ is a subspace such that $E \perp G$ and the following holds:

$$
u \perp(E+G) \Longrightarrow\langle\mathcal{K} u, u\rangle \geq \theta\|u\|_{L^{2}}^{2} .
$$

Then, for any other subspace $F$ we have

$$
u \perp(F+G) \Longrightarrow\langle K u, u\rangle \geq \theta \sin ^{2} \alpha\left(E, F^{\perp}\right)\|u\|_{L^{2}}^{2} .
$$

Proof. Suppose $u \perp(F+G)$ and consider its orthogonal decomposition, $u=P_{E} u+\tilde{u}$. Since $E \perp G$ and $u \perp G$, we have $\tilde{u} \perp(E+G)$. Hence, by the hypothesis we have

$$
\langle\mathcal{K} u, u\rangle=\langle\mathcal{K} \tilde{u}, \tilde{u}\rangle \geq \theta\|\tilde{u}\|_{L^{2}}^{2}=\theta\left\|P_{E^{\perp}} u\right\|_{L^{2}}^{2} .
$$

An application of (4.32),

$$
\sin \alpha\left(E, F^{\perp}\right)=\inf _{\substack{\|d\|=1 \\ d \in F^{\perp}}}\left\|P_{E^{\perp}} d\right\|_{L^{2}} \leq \frac{\left\|P_{E^{\perp}} u\right\|_{L^{2}}}{\|u\|_{L^{2}}}
$$

concludes the proof.

## 5. Set-up of the proof

Recall the definition of $T_{0}$ (for given $\delta_{0}>0$ and $\bar{a}, \bar{c}$ ) stated in the introduction. Recall

$$
B(a, c, t) \stackrel{\text { def }}{=} \int b(x, t) q^{2}(x, a, c) d x
$$

In the next several sections, we establish the key estimates required for the proof of the main theorem. Let us assume that on some time interval $[0, T]$, there are $C^{1}$ parameters $a(t) \in \mathbb{R}^{2}, c(t) \in \mathbb{R}^{2}$ such that, if we set

$$
\begin{equation*}
v(\cdot, t) \stackrel{\text { def }}{=} u(\cdot, t)-q(\cdot, a(t), c(t)) \tag{5.1}
\end{equation*}
$$

then the symplectic orthogonality conditions (3.26) hold. Since $u$ solves (1.1), $v(t)$ satisfies

$$
\begin{equation*}
\partial_{t} v=\partial_{x}\left(-\partial_{x}^{2} v-6 q^{2} v-6 q v^{2}-2 v^{3}+b v\right)-F_{0} \tag{5.2}
\end{equation*}
$$

where $F_{0}$ results from the perturbation and $\partial_{t}$ landing on the parameters:

$$
\begin{equation*}
F_{0} \stackrel{\text { def }}{=} \sum_{j=1}^{2}\left(\dot{a}_{j}-c_{j}^{2}\right) \partial_{a_{j}} q+\sum_{j=1}^{2} \dot{c}_{j} \partial_{c_{j}} q-\partial_{x}(b q) \tag{5.3}
\end{equation*}
$$

Now decompose

$$
F_{0}=F_{\|}+F_{\perp}
$$

where $F_{\|}$is symplectically parallel to $M$ and $F_{\perp}$ is symplectically orthogonal to $M$. Explicitly,

$$
\begin{gather*}
F_{\|}=\sum_{j=1}^{2}\left(\dot{a}_{j}-c_{j}^{2}+\frac{1}{2} \partial_{c_{j}} B\right) \partial_{a_{j}} q+\sum_{j=1}^{2}\left(\dot{c}_{j}-\frac{1}{2} \partial_{a_{j}} B\right) \partial_{c_{j}} q  \tag{5.4}\\
F_{\perp}=-\partial_{x}(b q)+\frac{1}{2} \sum_{j=1}^{2}\left[-\left(\partial_{c_{j}} B\right) \partial_{a_{j}} q+\left(\partial_{a_{j}} B\right) \partial_{c_{j}} q\right] \tag{5.5}
\end{gather*}
$$

All implicit constants will depend upon $\delta_{0}>0$ and $L^{\infty}$ norms of $b_{0}(x, t)$ and its derivatives. We further assume that

$$
\begin{equation*}
\delta_{0} \leq c_{1}(t) \leq c_{2}(t)-\delta_{0} \leq \delta_{0}^{-1} \tag{5.6}
\end{equation*}
$$

holds on all of $[0, T]$.
In $\S 6$ we will estimate $F_{\perp}$ using the properties of $q$ recalled in $\S 3$. We note that $F_{\|} \equiv 0$ would mean that the parameters solve the effective equations of motion (1.4). Hence the estimates on $F_{\|}$are related to the quality of our effective dynamics and they are provided in $\S 7$. In $\S 8$ we then construct a correction term which removes the leading non-homogeneous terms from the equation for $v$. Finally energy estimates in $\S 9$ based on the coercivity of $\mathcal{K}$ lead to the final bootstrap argument in $\S 10$.

## 6. Estimates on $F_{\perp}$

Using the identities in Lemma 3.4, we will prove that $F_{\perp}$ is $\mathcal{O}\left(h^{2}\right)$; in fact, we obtain more precise information. For notational convenience, we will drop the $t$ dependence in $b(x, t)$, and will write $b^{\prime}, b^{\prime \prime}, b^{\prime \prime \prime}$, to represent $x$-derivatives.

We will use the following consequences of Lemma 3.2:

$$
\begin{equation*}
\partial_{a_{j}} q=-\partial_{x} \eta\left(\cdot, \hat{a}_{j}, c_{j}\right)+\mathcal{S}_{\mathrm{err}} \tag{6.1}
\end{equation*}
$$

and

$$
\begin{align*}
c_{j} \partial_{c_{j}} q= & \partial_{x}\left[\left(x-a_{j}\right) \eta\left(x, \hat{a}_{j}, c_{j}\right)\right]+\frac{2 c_{3-j} \theta\left(a_{2}-a_{1}\right)}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \partial_{x} \eta\left(x, \hat{a}_{j}, c_{j}\right)  \tag{6.2}\\
& -\frac{2 c_{j} \theta\left(a_{2}-a_{1}\right)}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \partial_{x} \eta\left(x, \hat{a}_{3-j}, c_{3-j}\right)+\mathcal{S}_{\text {err }}
\end{align*}
$$

where $\theta$ is given by (3.6).
Importantly, as the last formula shows, $\partial_{c_{j}} q$ is not localized around $\hat{a}_{j}$ due to the $c_{j}$-dependence of $\hat{a}_{3-j}$. Also note that it is $\left(x-a_{j}\right)$ and not $\left(x-\hat{a}_{j}\right)$ in the first term inside the brackets.

Definition 6.1. Let $\mathcal{A}$ denote the class of functions of $a, c$ that are of the form

$$
h^{2} \varphi\left(a_{1}-a_{2}, a, c\right)+q(a, c) h^{3},
$$

$a=\left(a_{1}, a_{2}\right) \in \mathbb{R}^{2}, 0<\delta<c_{1}<c_{2}-\delta<1 / \delta$, where

$$
\left|\partial_{\alpha}^{\ell} \partial_{c}^{k} \partial_{a}^{p} \varphi(\alpha, a, c)\right| \leq C\langle\alpha\rangle^{-N}, \quad\left|\partial_{c}^{k} \partial_{a}^{p} q(a, c)\right| \leq C,
$$

where $C$ depends on $\delta, N, \ell, k$, and $p$ only.
We note that if $f \in \mathcal{S}_{\text {err }}$, then $\int f(x) d x$ has the form $\varphi\left(a_{1}-a_{2}, a, c\right), \varphi \in \mathcal{A}$. The most important feature of the class $\mathcal{A}$ is that for $f \in \mathcal{A}$,

$$
\left|\partial_{a_{j}}^{k} \partial_{c_{j}}^{\ell} f\right| \lesssim h^{2}\left\langle a_{1}-a_{2}\right\rangle^{-N}+h^{3}
$$

with implicit constant depending on $c_{1}, c_{2}$.
Lemma 6.1. We have

$$
\begin{align*}
\partial_{a_{j}} B(a, c, \cdot)= & 2 c_{j} b^{\prime}\left(\hat{a}_{j}\right)+\mathcal{A}  \tag{6.3}\\
\partial_{c_{j}} B(a, c, \cdot)= & 2 b\left(\hat{a}_{j}\right)+2 b^{\prime}\left(\hat{a}_{j}\right)\left(a_{j}-\hat{a}_{j}\right)-\frac{\pi^{2}}{12} b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2}  \tag{6.4}\\
& -\frac{2(-1)^{j} c_{3-j}\left(b^{\prime}\left(\hat{a}_{2}\right)-b^{\prime}\left(\hat{a}_{1}\right)\right) \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)}+\mathcal{A}
\end{align*}
$$

Proof. First we compute $\partial_{a_{j}} B(a, c, t)$. We have that $\partial_{a_{j}} q$ is exponentially localized around $\hat{a}_{j}$. Substituting the Taylor expansion of $b$ around $\hat{a}_{j}$, we obtain

$$
\begin{aligned}
\partial_{a_{j}} B(a, c, t)= & b\left(\hat{a}_{j}\right) \int \partial_{a_{j}} q^{2}+b^{\prime}\left(\hat{a}_{j}\right) \int\left(x-\hat{a}_{j}\right) \partial_{a_{j}} q^{2} \\
& +\frac{1}{2} b^{\prime \prime}\left(\hat{a}_{j}\right) \int\left(x-\hat{a}_{j}\right)^{2} \partial_{a_{j}} q^{2}+\mathcal{O}\left(h^{3}\right) \\
= & \mathrm{I}+\mathrm{II}+\mathrm{III}+\mathcal{O}\left(h^{3}\right)
\end{aligned}
$$

Terms I and II are straightforward. Using (3.21) and (3.22),

$$
\begin{aligned}
& \mathrm{I}=b\left(\hat{a}_{j}\right) \partial_{a_{j}} \int q^{2}=0 \\
& \mathrm{II}=b^{\prime}\left(\hat{a}_{j}\right)\left(\partial_{a_{j}} \int x q^{2}-\hat{a}_{j} \partial_{a_{j}} \int q^{2}\right)=2 c_{j} b^{\prime}\left(\hat{a}_{j}\right)
\end{aligned}
$$

For III, we will substitute (6.1) and hence pick up $\mathcal{O}\left(h^{2}\right)\left\langle a_{1}-a_{2}\right\rangle^{-N}$ errors.

$$
\mathrm{III}=-\frac{1}{2} b^{\prime \prime}\left(\hat{a}_{j}\right) \int\left(x-\hat{a}_{j}\right)^{2} \partial_{x} \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) d x+\mathcal{A}=\mathcal{A}
$$

Thus, we obtain (6.3). Next, we compute $\partial_{c_{j}} B(a, c, t)$. Note that $\partial_{c_{j}} q$ is not localized around $\hat{a}_{j}$. Begin by rewriting $\partial_{c_{j}} B$ as

$$
\partial_{c_{j}} B=\int b\left(\hat{a}_{j}\right) \partial_{c_{j}} q^{2}+\int b^{\prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right) \partial_{c_{j}} q^{2}+\int \tilde{b}_{j} \partial_{c_{j}} q^{2}
$$

where

$$
\tilde{b}_{j}(x) \stackrel{\text { def }}{=} b(x)-b\left(\hat{a}_{j}\right)-b^{\prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right) .
$$

Now substitute (6.2) into the last term and note that the $\mathcal{S}_{\text {err }}$ term in (6.2) produces an $\mathcal{A}$ term here.

$$
\begin{aligned}
\partial_{c_{j}} B= & \int b\left(\hat{a}_{j}\right) \partial_{c_{j}} q^{2}+\int b^{\prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right) \partial_{c_{j}} q^{2} \\
& +\frac{2}{c_{j}} \int \tilde{b}_{j}(x) \partial_{x}\left[\left(x-a_{j}\right) \eta\left(x, \hat{a}_{j}, c_{j}\right)\right] \eta\left(x, \hat{a}_{j}, c_{j}\right) \\
& +\frac{c_{3-j} \theta}{c_{j}\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \int \tilde{b}_{j}(x) \partial_{x} \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) \\
& -\frac{\theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \int \tilde{b}_{j}(x) \partial_{x} \eta^{2}\left(x, \hat{a}_{3-j}, c_{3-j}\right)+\mathcal{A} \\
= & \mathrm{I}+\mathrm{II}+\mathrm{III}+\mathrm{IV}+\mathrm{V}+\mathcal{A}
\end{aligned}
$$

where terms I-V are studied separately below.

$$
\begin{aligned}
\mathrm{I} & =b\left(\hat{a}_{j}\right) \partial_{c_{j}} \int q^{2}=2 b\left(\hat{a}_{j}\right) \\
\mathrm{II} & =b^{\prime}\left(\hat{a}_{j}\right)\left(\partial_{c_{j}} \int x q^{2}-\hat{a}_{j} \partial_{c_{j}} \int q^{2}\right) \\
& =2 b^{\prime}\left(\hat{a}_{j}\right)\left(a_{j}-\hat{a}_{j}\right)
\end{aligned}
$$

Term III is localized around $\hat{a}_{j}$, and thus we integrate by parts in $x$ and Taylor expand $\tilde{b}_{j}$ around $\hat{a}_{j}$ to obtain

$$
\begin{aligned}
\mathrm{III}= & \frac{1}{c_{j}} \int\left(-\tilde{b}_{j}^{\prime}(x)\left(x-a_{j}\right)+\tilde{b}_{j}(x)\right) \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) \\
= & -\frac{1}{2} \frac{b^{\prime \prime}\left(\hat{a}_{j}\right)}{c_{j}} \int\left(x-\hat{a}_{j}\right)^{2} \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) \\
& -b^{\prime \prime}\left(\hat{a}_{j}\right)\left(\hat{a}_{j}-a_{j}\right) \int\left(x-\hat{a}_{j}\right) \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right)+\mathcal{O}\left(h^{3}\right) \\
= & -\frac{\pi^{2}}{12} b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2}+\mathcal{O}\left(h^{3}\right)
\end{aligned}
$$

Term IV is localized around $\hat{a}_{j}$, and thus we integrate by parts in $x$ and Taylor expand $\tilde{b}_{j}$ around $\hat{a}_{j}$ to obtain

$$
\begin{aligned}
\int \tilde{b}_{j}(x) \partial_{x} \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) & =-\int\left(b^{\prime}(x)-b\left(\hat{a}_{j}\right)\right) \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right) \\
& =-\frac{1}{2} b^{\prime \prime}\left(\hat{a}_{j}\right) \int\left(x-\hat{a}_{j}\right) \eta^{2}\left(x, \hat{a}_{j}, c_{j}\right)+\mathcal{O}\left(h^{3}\right) \\
& =\mathcal{O}\left(h^{3}\right)
\end{aligned}
$$

Term V is localized around $\hat{a}_{3-j}$, and thus we integrate by parts in $x$ and Taylor expand $\tilde{b}_{j}$ around $\hat{a}_{3-j}$.

$$
\begin{aligned}
\int \tilde{b}_{j}(x) \partial_{x} \eta^{2}\left(x, \hat{a}_{3-j}, c_{3-j}\right)= & -\int\left(b^{\prime}(x)-b\left(\hat{a}_{j}\right)\right) \eta^{2}\left(x, \hat{a}_{3-j}, c_{3-j}\right) \\
=- & -\left(b^{\prime}\left(\hat{a}_{3-j}\right)-b^{\prime}\left(\hat{a}_{j}\right)\right) \int \eta^{2}\left(x, \hat{a}_{3-j}, c_{3-j}\right) \\
& -b^{\prime \prime}\left(\hat{a}_{3-j}\right) \int\left(x-\hat{a}_{3-j}\right) \eta^{2}\left(x, \hat{a}_{3-j}, c_{3-j}\right)+\mathcal{O}\left(h^{3}\right) \\
=- & 2 c_{3-j}\left(b^{\prime}\left(\hat{a}_{3-j}\right)-b^{\prime}\left(\hat{a}_{j}\right)\right)+\mathcal{O}\left(h^{3}\right)
\end{aligned}
$$

Lemma 6.2 (estimates on $F_{\perp}$ ).

$$
\begin{gather*}
\partial_{x}^{-1} \partial_{a_{j}} F_{\perp}=\mathcal{O}\left(h^{2}\right) \cdot \mathcal{S}_{\mathrm{sol}}, \quad \partial_{x}^{-1} \partial_{c_{j}} F_{\perp}=\mathcal{O}\left(h^{2}\right) \cdot \mathcal{S}_{\mathrm{sol}}, \quad j=1,2  \tag{6.5}\\
F_{\perp}=-\frac{1}{2} \sum_{j=1}^{2} \frac{b^{\prime \prime}\left(\hat{a}_{j}\right)}{c_{j}^{2}} \partial_{x} \tau\left(\cdot, \hat{a}_{j}, c_{j}\right)+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}} \tag{6.6}
\end{gather*}
$$

where

$$
\begin{equation*}
\tau \stackrel{\text { def }}{=}\left(\frac{\pi^{2}}{12}+x^{2}\right) \eta(x), \quad \tau\left(x, \hat{a}_{j}, c_{j}\right) \stackrel{\text { def }}{=} c_{j} \tau\left(c_{j}\left(x-\hat{a}_{j}\right)\right) . \tag{6.7}
\end{equation*}
$$

In light of the above lemma, we introduce the notation $F_{\perp}=\left(F_{\perp}\right)_{0}+\tilde{F}_{\perp}$, where

$$
\begin{equation*}
\left(F_{\perp}\right)_{0}=-\frac{1}{2} \sum_{j=1}^{2} \frac{b^{\prime \prime}\left(\hat{a}_{j}\right)}{c_{j}^{2}} \partial_{x} \tau\left(\cdot, \hat{a}_{j}, c_{j}\right) \tag{6.8}
\end{equation*}
$$

and $\tilde{F}_{\perp} \in \mathcal{A} \cdot \mathcal{S}_{\text {sol }}$. We make use of (6.5) in $\S 7$ and (6.6) in $\S 8-9$.

Proof. We begin by proving (6.6). By (3.18), (3.19),

$$
\begin{align*}
\partial_{x}(b q) & =\left(\partial_{x} b\right) q+b\left(\partial_{x} q\right) \\
& =\left(\partial_{x} b\right) \sum_{j=1}^{2}\left(\left(x-a_{j}\right) \partial_{a_{j}} q+c_{j} \partial_{c_{j}} q\right)-b \sum_{j=1}^{2} \partial_{a_{j}} q  \tag{6.9}\\
& =\sum_{j=1}^{2}\left(-b+\left(\partial_{x} b\right)\left(x-a_{j}\right)\right) \partial_{a_{j}} q+\sum_{j=1}^{2}\left(\partial_{x} b\right) c_{j} \partial_{c_{j}} q+\mathcal{O}\left(h^{3}\right) \cdot \mathcal{S}_{\text {sol }}
\end{align*}
$$

The $\partial_{a_{j}} q$ term is well localized around $\hat{a}_{j}$, and thus we can Taylor expand the coefficients around $\hat{a}_{j}$. The $\partial_{c_{j}} q$ term we leave alone for the moment.

We have $\partial_{x}(b q)=$

$$
\begin{aligned}
\sum_{j=1}^{2}\left(-b\left(\hat{a}_{j}\right)+b^{\prime}\left(\hat{a}_{j}\right)\left(\hat{a}_{j}-\right.\right. & \left.\left.a_{j}\right)+b^{\prime \prime}\left(\hat{a}_{j}\right)\left(\hat{a}_{j}-a_{j}\right)\left(x-\hat{a}_{j}\right)+\frac{1}{2} b^{\prime \prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right)^{2}\right) \partial_{a_{j}} q \\
& +\sum_{j=1}^{2} b^{\prime}(x) c_{j} \partial_{c_{j}} q+\mathcal{A} \cdot \mathcal{S}_{\text {sol }}
\end{aligned}
$$

Substituting the above together with (6.3) and (6.4) into (5.5), we obtain

$$
\begin{gathered}
F_{\perp}=\frac{1}{2} \sum_{j=1}^{2} b^{\prime \prime}\left(\hat{a}_{j}\right)\left(\frac{\pi^{2}}{12} c_{j}^{-2}-2\left(\hat{a}_{j}-a_{j}\right)\left(x-\hat{a}_{j}\right)-\left(x-\hat{a}_{j}\right)^{2}\right) \partial_{a_{j}} q \\
+\frac{\left(b^{\prime}\left(\hat{a}_{2}\right)-b^{\prime}\left(\hat{a}_{1}\right)\right) \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \sum_{j=1}^{2}(-1)^{j} c_{3-j} \partial_{a_{j}} q-\sum_{j=1}^{2}\left(b^{\prime}(x)-b^{\prime}\left(\hat{a}_{j}\right)\right) c_{j} \partial_{c_{j}} q+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
\end{gathered}
$$

We now substitute (6.1) and (6.2) recognizing that this will only generate errors of type $\mathcal{A}$ times a Schwartz class function. We also Taylor expand around $\hat{a}_{j}$ or $\hat{a}_{3-j}$
depending upon the localization.

$$
\begin{array}{rlrl}
F_{\perp}= & \frac{1}{2} \sum_{j=1}^{2} b^{\prime \prime}\left(\hat{a}_{j}\right)\left(-\frac{\pi^{2}}{12} c_{j}^{-2}+2\left(\hat{a}_{j}-a_{j}\right)\left(x-\hat{a}_{j}\right)+\left(x-\hat{a}_{j}\right)^{2}\right) \partial_{x} \eta\left(x, \hat{a}_{j}, c_{j}\right) & & \leftarrow \mathrm{I} \\
& -\frac{\left(b^{\prime}\left(\hat{a}_{2}\right)-b^{\prime}\left(\hat{a}_{1}\right)\right) \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} \sum_{j=1}^{2}(-1)^{j} c_{3-j} \partial_{x} \eta\left(x, \hat{a}_{j}, c_{j}\right) & & \leftarrow \mathrm{II} \\
& -\sum_{j=1}^{2} b^{\prime \prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right) \partial_{x}\left[\left(x-a_{j}\right) \eta\left(x, \hat{a}_{j}, c_{j}\right)\right] & & \leftarrow \mathrm{III} \\
& -\sum_{j=1}^{2} \frac{c_{3-j} \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} b^{\prime \prime}\left(\hat{a}_{j}\right)\left(x-\hat{a}_{j}\right) \partial_{x} \eta\left(x, \hat{a}_{j}, c_{j}\right) & \leftarrow \mathrm{IV} \\
& +\sum_{j=1}^{2} \frac{c_{j} \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)} b^{\prime \prime}\left(\hat{a}_{3-j}\right)\left(x-\hat{a}_{3-j}\right) \partial_{x} \eta\left(x, \hat{a}_{3-j}, c_{3-j}\right) & \leftarrow \mathrm{V} \\
& +\sum_{j=1}^{2} \frac{c_{j} \theta}{\left(c_{1}+c_{2}\right)\left(c_{1}-c_{2}\right)}\left(b^{\prime}\left(\hat{a}_{3-j}\right)-b^{\prime}\left(a_{j}\right)\right) \partial_{x} \eta\left(x, \hat{a}_{3-j}, c_{3-j}\right) & \leftarrow \mathrm{VI} \\
& +\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}} & &
\end{array}
$$

We have that $\mathrm{IV}+\mathrm{V}=0$ and $\mathrm{II}+\mathrm{VI}=0$. Hence

$$
\begin{aligned}
F_{\perp} & =\mathrm{I}+\mathrm{III}+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}} \\
& =-\frac{1}{2} \sum_{j=1}^{2} b^{\prime \prime}\left(\hat{a}_{j}\right) \partial_{x}\left(\left(\frac{\pi^{2}}{12} c_{j}^{-2}+\left(x-\hat{a}_{j}\right)^{2}\right) \eta\left(x, \hat{a}_{j}, c_{j}\right)\right)
\end{aligned}
$$

This completes the proof of (6.6). To obtain (6.5), we note that a consequence of (6.6) is $F_{\perp}=\mathcal{O}\left(h^{2}\right) f$, where $f \in \mathcal{S}_{\text {sol }}$. By the definition (5.5) of $F_{\perp}$ and Corollary 3.3, we have $\partial_{x}^{-1} F_{\perp} \in \mathcal{S}_{\text {sol }}$, and hence $f \in \mathcal{S}_{\text {sol }}$.

## 7. Estimates on the parameters

The equations of motion are recovered (in approximate form) using the symplectic orthogonality properties (3.26) of $v$ and the equation (5.2) for $v$. For a function $G$ of the form

$$
G=g_{1} \partial_{a_{1}} q+g_{2} \partial_{a_{2}} q+g_{3} \partial_{c_{1}} q+g_{4} \partial_{c_{2}} q
$$

with $g_{j}=g_{j}(a, c)$, define

$$
\operatorname{coef}(G)=\left(g_{1}, g_{2}, g_{3}, g_{4}\right)
$$

Lemma 7.1. Suppose we are given $\delta_{0}>0$ and $b_{0}(x, t)$, and parameters $a(t), c(t)$ such that $v$ defined by (5.1) satisfies the symplectic orthogonality conditions (3.26). Suppose, moreover, that the amplitude separation condition (5.6) holds. Then (with
implicit constants depending upon $\delta_{0}>0$ and $L^{\infty}$ norms of $b_{0}$ and its derivatives), if $\|v\|_{H^{2}} \lesssim 1$, then we have

$$
\begin{equation*}
\left|\operatorname{coef}\left(F_{\|}\right)\right| \lesssim h^{2}\|v\|_{H^{1}}+\|v\|_{H^{1}}^{2} \tag{7.1}
\end{equation*}
$$

Proof. Since $\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0$, we have upon substituting (5.2)

$$
\begin{array}{rlrl}
0= & \partial_{t}\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle & \\
== & \left.\partial_{t} v, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle+\left\langle v, \partial_{t} \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle & & \\
= & \left\langle\left(\partial_{x}^{2} v+6 q^{2}\right) v, \partial_{a_{j}} q\right\rangle+\left\langle\left(6 q v^{2}+2 v^{3}\right), \partial_{a_{j}} q\right\rangle & & \leftarrow \mathrm{I}+\mathrm{II} \\
& -\left\langle b v, \partial_{a_{j}} q\right\rangle-\left\langle F_{\|}, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle-\left\langle F_{\perp}, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle & \leftarrow \mathrm{III}+\mathrm{IV}+\mathrm{V} \\
& +\left\langle v, \partial_{x}^{-1} \partial_{a_{j}}\left(\sum_{k=1}^{2} \partial_{a_{k}} q \dot{a}_{k}+\sum_{k=1}^{2} \partial_{c_{k}} q \dot{c}_{k}\right)\right\rangle & & \leftarrow \mathrm{VI}
\end{array}
$$

We have, by (3.17),

$$
\begin{aligned}
\mathrm{I} & =\left\langle v, \partial_{a_{j}}\left(\partial_{x}^{2} q+2 q^{3}\right)\right\rangle \\
& =-\frac{1}{2}\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} \partial_{x} I_{3}^{\prime}(q)\right\rangle \\
& =-\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} \sum_{k=1}^{2} c_{k}^{2} \partial_{a_{k}} q\right\rangle
\end{aligned}
$$

Also, by (5.5)

$$
\begin{aligned}
\mathrm{III} & =-\left\langle b v, \partial_{a_{j}} q\right\rangle \\
& =-\left\langle v, \partial_{a_{j}}(b q)\right\rangle \\
& =-\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} \partial_{x}(b q)\right\rangle \\
& =-\left\langle v, \partial_{x}^{-1} \partial_{a_{j}}\left(-F_{\perp}-\frac{1}{2} \sum_{k=1}^{2}\left(\partial_{c_{k}} B\right) \partial_{a_{k}} q+\frac{1}{2} \sum_{k=1}^{2}\left(\partial_{a_{k}} B\right) \partial_{c_{k}} q\right)\right\rangle
\end{aligned}
$$

Thus

$$
\begin{aligned}
|\mathrm{I}+\mathrm{III}+\mathrm{VI}| & =\left|\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} F_{\perp}\right\rangle+\left\langle v, \partial_{x}^{-1} \partial_{a_{j}} F_{\|}\right\rangle\right| \\
& \leq\|v\|_{L^{2}}\left(\left\|\partial_{x}^{-1} \partial_{a_{j}} F_{\perp}\right\|_{L^{2}}+\left\|\partial_{x}^{-1} \partial_{a_{j}} F_{\|}\right\|\right) \\
& \leq\|v\|_{L^{2}}\left(h^{2}+\left|\operatorname{coef}\left(F_{\|}\right)\right|\right)
\end{aligned}
$$

Next, we note that by Cauchy-Schwarz,

$$
|\mathrm{II}| \lesssim\|v\|_{H^{1}}^{2}
$$

Next, observe from (5.4) and Lemma 3.6 that

$$
\mathrm{IV}=\left\langle F_{\|}, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=-\left(\dot{c}_{j}-\frac{1}{2} \partial_{a_{j}} B\right)
$$

Of course, we have $\mathrm{V}=\left\langle F_{\perp}, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0$. Combining, we obtain

$$
\begin{equation*}
\left|\dot{c}_{j}-\frac{1}{2} \partial_{a_{j}} B\right| \lesssim\|v\|_{H^{1}}\left(h^{2}+\left|\operatorname{coef}\left(F_{\|}\right)\right|\right)+\|v\|_{H^{1}}^{2} . \tag{7.2}
\end{equation*}
$$

A similar calculation, applying $\partial_{t}$ to the identity $0=\left\langle v, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle$, yields

$$
\begin{equation*}
\left|\dot{a}_{j}-c_{j}^{2}+\frac{1}{2} \partial_{c_{j}} B\right| \lesssim\|v\|_{H^{1}}\left(h^{2}+\left|\operatorname{coef}\left(F_{\|}\right)\right|\right)+\|v\|_{H^{1}}^{2} . \tag{7.3}
\end{equation*}
$$

Combining (7.2) and (7.3) gives (7.1).

## 8. Correction term

Recall the definition (6.7) of $\tau$. Let $\rho$ be the unique function solving

$$
\left(1-\partial_{x}^{2}-6 \eta^{2}\right) \rho=\tau
$$

see [19, Proposition 4.2] for the properties of this equation. The function $\rho$ is smooth, exponentially decaying at $\infty$, and satisfies the symplectic orthogonality conditions

$$
\begin{equation*}
\langle\rho, \eta\rangle=0, \quad\langle\rho, x \eta\rangle=0 \tag{8.1}
\end{equation*}
$$

Set

$$
\rho\left(x, \hat{a}_{j}, c_{j}\right) \stackrel{\text { def }}{=} c_{j}^{-1} \rho\left(c_{j}\left(x-\hat{a}_{j}\right)\right)
$$

and note that

$$
\left(c_{j}^{2}-\partial_{x}^{2}-6 \eta^{2}\left(\cdot, \hat{a}_{j}, c_{j}\right)\right) \rho\left(\cdot, \hat{a}_{j}, c_{j}\right)=\tau\left(\cdot, \hat{a}_{j}, c_{j}\right)
$$

Define the symplectic projection operator

$$
P f \stackrel{\text { def }}{=} \sum_{j=1}^{2}\left\langle f, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle \partial_{a_{j}} q+\sum_{j=1}^{2}\left\langle f, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle \partial_{c_{j}} q .
$$

Define

$$
\begin{equation*}
w \stackrel{\text { def }}{=}-\frac{1}{2}(I-P) \sum_{j=1}^{2} \frac{b^{\prime \prime}\left(\hat{a}_{j}\right)}{c_{j}^{2}} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right) \tag{8.2}
\end{equation*}
$$

Note that $w=\mathcal{O}\left(h^{2}\right)$ and clearly now $w$ satisfies

$$
\begin{equation*}
\left\langle w, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0, \quad\left\langle w, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0 \tag{8.3}
\end{equation*}
$$

Recall the definition (6.8) of $\left(F_{\perp}\right)_{0}$.
Lemma 8.1. If $\dot{c}_{j}=\mathcal{O}(h)$, and $\dot{a}_{j}=c_{j}-b\left(\hat{a}_{j}\right)+\mathcal{O}(h)$, then

$$
\begin{equation*}
\partial_{t} w+\partial_{x}\left(\partial_{x}^{2} w+6 q^{2} w-b w\right)=-\left(F_{\perp}\right)_{0}-G+\mathcal{A} \cdot \mathcal{S}_{\text {sol }} . \tag{8.4}
\end{equation*}
$$

where $G$ is an $\mathcal{O}\left(h^{2}\right)$ term that is symplectically parallel to $M$, i.e.

$$
G \in \operatorname{span}\left\{\partial_{x}^{-1} \partial_{a_{1}} q, \partial_{x}^{-1} \partial_{a_{2}} q, \partial_{x}^{-1} \partial_{c_{1}} q, \partial_{x}^{-1} \partial_{c_{2}} q\right\} .
$$

Proof. Let

$$
w_{j}=\frac{b^{\prime \prime}\left(\hat{a}_{j}\right)}{c_{j}^{2}} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right)
$$

Then

$$
\begin{aligned}
\partial_{t} w_{j}= & b^{\prime \prime \prime}\left(\hat{a}_{j}\right) \dot{\hat{a}}_{j} c_{j}^{-2} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right)-2 b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-3} \dot{c}_{j} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right) \\
& +b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \dot{\hat{a}}_{j} \partial_{a_{j}} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right)+b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \dot{\hat{c}}_{j} \partial_{c_{j}} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right)+\partial_{t} b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \rho\left(\cdot, \hat{a}_{j}, c_{j}\right) \\
= & -\dot{a}_{j} \partial_{x} w_{j}+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
\end{aligned}
$$

Also, we have

$$
\begin{aligned}
\left(\partial_{x}^{2}+6 q^{2}\right) w_{j} & =\left(\partial_{x}^{2}+6 \eta^{2}\left(\cdot, \hat{a}_{j}, c_{j}\right)\right) w_{j}+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}} \\
& =c_{j}^{2} w_{j}-b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \tau\left(\cdot, \hat{a}_{j}, c_{j}\right)+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
\end{aligned}
$$

Also,

$$
b w_{j}=b\left(\hat{a}_{j}\right) w_{j}+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
$$

Combining, we obtain

$$
\begin{aligned}
\partial_{t} w_{j} & +\partial_{x}\left(\partial_{x}^{2} w_{j}+6 q^{2} w_{j}-b w_{j}\right) \\
& =-b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \partial_{x} \tau\left(\cdot, \hat{a}_{j}, c_{j}\right)+\left(-\dot{a}_{j}+c_{j}^{2}-b\left(\hat{a}_{j}\right)\right) \partial_{x} w_{j}+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}} \\
& =-b^{\prime \prime}\left(\hat{a}_{j}\right) c_{j}^{-2} \partial_{x} \tau\left(\cdot, \hat{a}_{j}, c_{j}\right)+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
\end{aligned}
$$

Now we discuss $\partial_{t} P w_{j}$.

$$
\begin{aligned}
\partial_{t} P w_{j}= & \left\langle\partial_{t} w_{j}, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle \partial_{c_{1}} q+\left\langle w_{j}, \partial_{t} \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle \partial_{c_{j}} q+\text { similar } \\
& +\left\langle w_{j}, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle \partial_{t} \partial_{c_{1}} q+\text { similar }
\end{aligned}
$$

The first line of terms is symplectically parallel to $M$. For the second line, note that by (8.1), we have $\left\langle w_{j}, \partial_{x}^{-1} \partial_{a_{1}} q\right\rangle=\mathcal{A}$. Consequently,

$$
\partial_{t} P w_{j}=T_{q} M+\mathcal{A} \cdot \mathcal{S}_{\mathrm{sol}}
$$

Define $\tilde{u}$ and $\tilde{v}$ by

$$
\begin{equation*}
u=\tilde{u}+w, \quad v=\tilde{v}+w . \tag{8.5}
\end{equation*}
$$

Of course, it follows that $\tilde{u}=q+\tilde{v}$. Note that by (3.26) and (8.3), we have

$$
\begin{equation*}
\left\langle\tilde{v}, \partial_{x}^{-1} \partial_{a_{j}} q\right\rangle=0 \text { and }\left\langle\tilde{v}, \partial_{x}^{-1} \partial_{c_{j}} q\right\rangle=0, j=1,2 . \tag{8.6}
\end{equation*}
$$

Note that $\tilde{u}$ solves

$$
\begin{equation*}
\partial_{t} \tilde{u}=-\partial_{x}\left(\partial_{x}^{2} \tilde{u}+2 \tilde{u}^{3}-b \tilde{u}\right)-\partial_{t} w-\partial_{x}\left(\partial_{x}^{2} w+6 \tilde{u}^{2} w-b w\right)+\mathcal{O}\left(h^{4}\right) \tag{8.7}
\end{equation*}
$$

where the $\mathcal{O}\left(h^{4}\right)$ terms arise from $w^{2}$ and $w^{3}$. Moreover, if we make the mild assumption that $\tilde{v}=\mathcal{O}(h)$, then $\tilde{u}^{2} w=q^{2} w+\mathcal{O}\left(h^{3}\right)$. By (8.7) and (8.4), we have

$$
\begin{equation*}
\partial_{t} \tilde{u}=-\partial_{x}\left(\partial_{x}^{2} \tilde{u}+2 \tilde{u}^{3}-b \tilde{u}\right)+\left(F_{\perp}\right)_{0}+G+\mathcal{A} \cdot \mathcal{S}_{\text {sol }} \tag{8.8}
\end{equation*}
$$

Since $\tilde{u}=q+\tilde{v}$, we have (in analogy with (5.2))

$$
\begin{equation*}
\partial_{t} \tilde{v}=\partial_{x}\left(-\partial_{x}^{2} \tilde{v}-6 q^{2} \tilde{v}+b \tilde{v}\right)-F_{\|}-\tilde{F}_{\perp}+G+\mathcal{A} \cdot \mathcal{S}_{\text {sol }}+O\left(h^{3}\right) H^{1} \tag{8.9}
\end{equation*}
$$

where we have made the assumption that $\tilde{v}=\mathcal{O}\left(h^{3 / 2}\right)$ in order to discard the $\tilde{v}^{2}$ and $\tilde{v}^{3}$ terms. We thus see that, in comparison to $v$, the equation for $\tilde{v}$ has a lower-order inhomogeneity, but still satisfies the symplectic orthogonality conditions (8.6) and $v=\tilde{v}+\mathcal{O}\left(h^{2}\right)$.

## 9. Energy estimate

Since $w=\mathcal{O}\left(h^{2}\right)$, to obtain the desired bound on $v$ it will suffice to obtain a bound for $\tilde{v}$. This will be achieved by the "energy method."

Lemma 9.1. Suppose we are given $\delta_{0}>0$ and $b_{0}(x, t)$, and parameters $a(t), c(t)$ such that $v$ defined by (5.1) satisfies the symplectic orthogonality conditions (3.26) on $[0, T]$. Suppose, moreover, that the amplitude separation condition (5.6) holds on $[0, T]$. Then (with implicit constants depending upon $\delta_{0}>0$ and $L^{\infty}$ norms of $b_{0}$ and its derivatives), if $\|v\|_{H^{2}} \lesssim 1$ and $T \ll h^{-1}$, then

$$
\|v\|_{L_{[0, T]}^{\infty} H^{2}}^{2} \lesssim\|v(0)\|_{H^{2}}^{2}+h^{4}\left(1+\int_{0}^{T}\left\langle a_{1}-a_{2}\right\rangle^{-N} d t\right)^{2}
$$

Proof. Recall that we have defined

$$
H_{c}(u)=I_{5}(u)+\left(c_{1}^{2}+c_{2}^{2}\right) I_{3}(u)+c_{1}^{2} c_{2}^{2} I_{1}(u) .
$$

With $w$ given by (8.2) and $\tilde{u}$ given by (8.5), let

$$
\mathcal{E}(t)=H_{c}(\tilde{u})-H_{c}(q) .
$$

Then

$$
\begin{aligned}
\partial_{t} \mathcal{E}= & \left\langle H_{c}^{\prime}(\tilde{u}), \partial_{t} \tilde{u}\right\rangle-\left\langle H_{c}^{\prime}(q), \partial_{t} q\right\rangle+2\left(c_{1} \dot{c}_{1}+c_{2} \dot{c}_{2}\right)\left(I_{3}(\tilde{u})-I_{3}(q)\right) \\
& +2 c_{1} c_{2}\left(c_{1} \dot{c}_{2}+\dot{c}_{1} c_{2}\right)\left(I_{1}(\tilde{u})-I_{1}(q)\right) \\
= & \mathrm{I}+\mathrm{II}+\mathrm{III}+\mathrm{IV}
\end{aligned}
$$

Note that II $=0$ since Lemma 4.1 showed that $H_{c}^{\prime}(q)=0$. For III, we have by (3.17) and the orthogonality conditions (8.6),

$$
\begin{aligned}
\mathrm{III} & =2\left(c_{1} \dot{c}_{1}+c_{2} \dot{c}_{2}\right)\left(\left\langle I_{3}^{\prime}(q), \tilde{v}\right\rangle+\mathcal{O}\left(\|\tilde{v}\|_{H^{1}}^{2}\right)\right) \\
& =4\left(c_{1} \dot{c}_{1}+c_{2} \dot{c}_{2}\right)\left\langle\sum_{j=1}^{2} c_{j}^{2} \partial_{x}^{-1} \partial_{a_{j}} q, \tilde{v}\right\rangle+\mathcal{O}\left(\left(\left|\dot{c}_{1}\right|+\left|\dot{c}_{2}\right|\right)\|\tilde{v}\|_{H^{1}}^{2}\right) \\
& =\mathcal{O}\left(\left(\left|\dot{c}_{1}\right|+\left|\dot{c}_{2}\right|\right)\|\tilde{v}\|_{H^{1}}^{2}\right)
\end{aligned}
$$

Term IV is bounded similarly. It remains to study Term I. Writing (8.8) as $\partial_{t} \tilde{u}=$ $\frac{1}{2} \partial_{x} I_{3}^{\prime}(\tilde{u})+\partial_{x}(b \tilde{u})+\left(F_{\perp}\right)_{0}+G+\mathcal{A} \cdot \mathcal{S}_{\text {sol }}$ and appealing to (2.5), we have by Lemma 2.1 (with $u$ replaced by $\tilde{u}$ in that lemma) that

$$
\begin{aligned}
\mathrm{I}= & \left\langle H_{c}^{\prime}(\tilde{u}), \partial_{x}(b \tilde{u})\right\rangle+\left\langle H_{c}^{\prime}(\tilde{u}),\left(F_{\perp}\right)_{0}+\mathcal{A} \cdot \mathcal{S}_{\text {sol }}\right\rangle \\
= & 5\left\langle b_{x}, A_{5}(\tilde{u})\right\rangle-5\left\langle b_{x x x}, A_{3}(\tilde{u})\right\rangle+\left\langle b_{x x x x x}, A_{1}(\tilde{u})\right\rangle \\
& +\left(c_{1}^{2}+c_{2}^{2}\right)\left(3\left\langle b_{x}, A_{3}(\tilde{u})\right\rangle-\left\langle b_{x x x}, A_{1}(\tilde{u})\right\rangle\right)+c_{1}^{2} c_{2}^{2}\left\langle b_{x}, A_{1}(\tilde{u})\right\rangle \\
& +\left\langle H_{c}^{\prime}(\tilde{u}),\left(F_{\perp}\right)_{0}+\mathcal{A} \cdot \mathcal{S}_{\text {sol }}\right\rangle
\end{aligned}
$$

Expand $A_{j}(\tilde{u})=A_{j}(q+\tilde{v})=A_{j}(q)+A_{j}^{\prime}(q)(\tilde{v})+\mathcal{O}\left(\tilde{v}^{2}\right)$ and $H_{c}^{\prime}(\tilde{u})=H_{c}^{\prime}(q)+\mathcal{K}_{c, a} \tilde{v}+$ $\mathcal{O}\left(\tilde{v}^{2}\right)=\mathcal{K}_{c, a} \tilde{v}+\mathcal{O}\left(\tilde{v}^{2}\right)$ to obtain $\mathrm{I}=\mathrm{IA}+\mathrm{IB}+\mathrm{IC}$, where

$$
\begin{aligned}
\mathrm{IA}= & 5\left\langle b_{x}, A_{5}(q)\right\rangle-5\left\langle b_{x x x}, A_{3}(q)\right\rangle+\left\langle b_{x x x x x}, A_{1}(q)\right\rangle \\
& +\left(c_{1}^{2}+c_{2}^{2}\right)\left(3\left\langle b_{x}, A_{3}(q)\right\rangle-\left\langle b_{x x x}, A_{1}(q)\right\rangle\right)+c_{1}^{2} c_{2}^{2}\left\langle b_{x}, A_{1}(q)\right\rangle \\
\mathrm{IB}= & 5\left\langle b_{x}, A_{5}^{\prime}(q)(\tilde{v})\right\rangle-5\left\langle b_{x x x}, A_{3}^{\prime}(q)(\tilde{v})\right\rangle+\left\langle b_{x x x x x}, A_{1}^{\prime}(q)(\tilde{v})\right\rangle \\
& +\left(c_{1}^{2}+c_{2}^{2}\right)\left(3\left\langle b_{x}, A_{3}^{\prime}(q)(\tilde{v})\right\rangle-\left\langle b_{x x x}, A_{1}^{\prime}(q)(\tilde{v})\right\rangle\right)+c_{1}^{2} c_{2}^{2}\left\langle b_{x}, A_{1}^{\prime}(q)(\tilde{v})\right\rangle \\
\mathrm{IC}= & \left\langle\mathcal{K}_{c, a} \tilde{v},\left(F_{\perp}\right)_{0}\right\rangle+\mathcal{O}\left(h\|\tilde{v}\|_{H^{2}}^{2}\right)+\mathcal{O}\left(\mathcal{A} \cdot\|\tilde{v}\|_{H^{2}}\right)
\end{aligned}
$$

Then reapply Lemma 2.1 (with $u$ replaced by $q$ in that lemma) to obtain that $\mathrm{IA}=$ $-\left\langle H_{c}^{\prime}(q), \partial_{x}(b q)\right\rangle=0$. Applying Lemma 2.2,

$$
\begin{aligned}
\mathrm{IB} & =\left\langle\mathcal{K}_{c, a} \tilde{v},(b q)_{x}\right\rangle-\left\langle\partial_{x} H_{c}^{\prime}(q), b \tilde{v}\right\rangle \\
& =\left\langle\mathcal{K}_{c, a} \tilde{v},(b q)_{x}\right\rangle
\end{aligned}
$$

In summary thus far, we have obtained that

$$
\partial_{t} \mathcal{E}=\left\langle\mathcal{K}_{c, a} \tilde{v},(b q)_{x}+\left(F_{\perp}\right)_{0}\right\rangle+\mathcal{O}\left(h\|\tilde{v}\|_{H^{2}}^{2}\right)+\mathcal{O}\left(\mathcal{A}\|\tilde{v}\|_{H^{2}}\right)
$$

By (4.12), (4.13), and (8.6) (recalling the definition (5.3) of $F_{0}$ ), we obtain

$$
\left\langle\mathcal{K}_{c, a} \tilde{v}, \partial_{x}(b q)\right\rangle=-\left\langle\mathcal{K}_{c, a} \tilde{v}, F_{0}\right\rangle=-\left\langle\mathcal{K}_{c, a} \tilde{v}, F_{\|}+F_{\perp}\right\rangle
$$

Hence

$$
\partial_{t} \mathcal{E}=-\left\langle\mathcal{K}_{c, a} \tilde{v}, F_{\|}+\tilde{F}_{\perp}\right\rangle+\mathcal{O}\left(h\|\tilde{v}\|_{H^{2}}^{2}\right)+\mathcal{O}\left(\mathcal{A}\|\tilde{v}\|_{H^{2}}\right)
$$

It follows from Lemma 7.1 and $\tilde{F}_{\perp} \in \mathcal{A} \cdot \mathcal{S}_{\text {sol }}$ (see (6.6), (6.8)) that

$$
\left|\partial_{t} \mathcal{E}\right| \lesssim\left(h^{2}\left\langle a_{1}-a_{2}\right\rangle^{-N}+h^{3}\right)\|\tilde{v}\|_{H^{2}}+h\|\tilde{v}\|_{H^{2}}^{2}
$$

If $T=\delta h^{-1}$,

$$
\mathcal{E}(T)=\mathcal{E}(0)+h^{2}\left(1+\int_{0}^{T}\left\langle a_{1}-a_{2}\right\rangle^{-N}\right)\|\tilde{v}\|_{L_{[0, T]}^{\infty} H_{x}^{2}}+h\|\tilde{v}\|_{L_{[0, T]}^{\infty} H^{2}}^{2} .
$$

By Lemma 4.1, the definition of $\mathcal{E}$ and $\mathcal{K}_{c, a}$, and the fact that $\tilde{u}=q+\tilde{v}$, we have

$$
\left|\mathcal{E}-\left\langle\mathcal{K}_{c, a} \tilde{v}, \tilde{v}\right\rangle\right| \lesssim\|\tilde{v}\|_{H^{2}}^{3} .
$$

Applying this at time 0 and $T$, together with the coercivity of $\mathcal{K}$ (Proposition 4.3),

$$
\|\tilde{v}(T)\|_{H^{2}}^{2} \lesssim\|\tilde{v}(0)\|_{H^{2}}^{2}+h^{2}\left(1+\int_{0}^{T}\left\langle a_{1}-a_{2}\right\rangle^{-N}\right)\|\tilde{v}\|_{L_{[0, T]}^{\infty} H_{x}^{2}}+h\|\tilde{v}\|_{L_{[0, T]}^{\infty} H^{2}}^{2} .
$$

Replacing $T$ by $T^{\prime}$ such that $0 \leq T^{\prime} \leq T$, and taking the supremum in $T^{\prime}$ over $0 \leq T^{\prime} \leq T$, we obtain

$$
\|\tilde{v}\|_{L_{[0, T]}^{\infty} H^{2}}^{2} \lesssim\|\tilde{v}(0)\|_{H^{2}}^{2}+h^{2}\left(1+\int_{0}^{T}\left\langle a_{1}-a_{2}\right\rangle^{-N}\right)\|\tilde{v}\|_{L_{[0, T]}^{\infty} H_{x}^{2}}+h\|\tilde{v}\|_{L_{[0, T]}^{\infty} H^{2}}^{2}
$$

By selecting $\delta$ small enough, we obtain

$$
\|\tilde{v}\|_{L_{[0, T]}^{\infty} H^{2}}^{2} \lesssim\|\tilde{v}(0)\|_{H^{2}}^{2}+h^{4}\left(1+\int_{0}^{T}\left\langle a_{1}-a_{2}\right\rangle^{-N} d t\right)^{2}
$$

Finally, using that $\|w\|_{H^{2}} \sim h^{2}$, and $v=\tilde{v}+w$, we obtained the claimed estimate.

## 10. Proof of the main theorem

We start with the proposition which links the ODE analysis with the estimates on the error term $v$ :

Proposition 10.1. Suppose we are given $b_{0} \in C_{b}^{\infty}\left(\mathbb{R}^{2}\right)$ and $\delta_{0}>0$. (Implicit constants below depend only on $b_{0}$ and $\delta_{0}$ ). Suppose that we are further given $\bar{a} \in \mathbb{R}^{2}$, $\bar{c} \in \mathbb{R}^{2} \backslash \mathcal{C}, \kappa \geq 1, h>0$, and $v_{0}$ satisfying (3.26), such that

$$
0<h \lesssim \kappa^{-1}, \quad\left\|v_{0}\right\|_{H_{x}^{2}} \leq \kappa h^{2}
$$

Let $u(t)$ be the solution to (1.1) with $b(x, t)=b_{0}(h x, h t)$ and initial data $\eta(\cdot, \bar{a}, \bar{c})+v_{0}$. Then there exist a time $T^{\prime}>0$ and trajectories $a(t)$ and $c(t)$ defined on $\left[0, T^{\prime}\right]$ such that $a(0)=\bar{a}, c(0)=\bar{c}$ and the following holds, with $v \stackrel{\text { def }}{=} u-\eta(\cdot, a, c)$ :
(1) On $\left[0, T^{\prime}\right]$, the orthogonality conditions (3.26) hold.
(2) Either $c_{1}\left(T^{\prime}\right)=\delta_{0}, c_{1}\left(T^{\prime}\right)=c_{2}\left(T^{\prime}\right)-\delta_{0}, c_{2}\left(T^{\prime}\right)=\delta_{0}^{-1}$, or $T^{\prime}=\omega h^{-1}$, where $\omega \ll 1$.
(3) $\left|\dot{a}_{j}-c_{j}^{2}+b\left(a_{j}, t\right)\right| \lesssim h$.
(4) $\left|\dot{c}_{j}-c_{j} b^{\prime}\left(a_{j}\right)\right| \lesssim h^{2}$.
(5) $\|v\|_{L_{\left[0, T^{\prime}\right]}^{\infty} H_{x}^{2}} \leq \alpha \kappa h^{2}$, where $\alpha \gg 1$.

Here $\alpha$ and $\omega$ are constants depending only on $b_{0}$ and $\delta_{0}$ (independent of $\kappa$, etc)
Proof. Recall our convention that implicit constants depend only on $b_{0}$ and $\delta$. By Lemma 3.7 and the continuity of the flow $u(t)$ in $H^{2}$, there exists some $T^{\prime \prime}>0$ on which $a(t), c(t)$ can be defined so that (3.26) hold. Now take $T^{\prime \prime}$ to be the maximal time on which $a(t), c(t)$ can be defined so that (3.26) holds. Let $T^{\prime}$ be first time $0 \leq T^{\prime} \leq T^{\prime \prime}$ such that $c_{1}\left(T^{\prime}\right)=\delta_{0}, c_{1}\left(T^{\prime}\right)=c_{2}\left(T^{\prime}\right)-\delta_{0}, c_{2}\left(T^{\prime}\right)=\delta_{0}^{-1}, T^{\prime}=T^{\prime \prime}$, or $\omega h^{-1}$ (whichever comes first). Here, $0<\omega \ll 1$ is a constant that we will chosen
suitably small at the end of the proof (depending only upon implicit constants in the estimates, and hence only on $b_{0}$ and $\delta$ ).

Remark 10.2. We will show that on $\left[0, T^{\prime}\right]$, we have $\|v(t)\|_{H_{x}^{2}} \lesssim \kappa h^{2}$, and hence by Lemma 3.7 and the continuity of the $u(t)$ flow, it must be the case that either $c_{1}\left(T^{\prime}\right)=\delta_{0}, c_{1}\left(T^{\prime}\right)=c_{2}\left(T^{\prime}\right)-\delta_{0}, c_{2}\left(T^{\prime}\right)=\delta_{0}^{-1}$, or $\omega h^{-1}$ (i.e. the case $T^{\prime}=T^{\prime \prime}$ does not arise).

Let $T, 0<T \leq T^{\prime}$, be the maximal time such that

$$
\begin{equation*}
\|v\|_{L_{[0, T]}^{\infty} H_{x}^{2}} \leq \alpha \kappa h^{2} \tag{10.1}
\end{equation*}
$$

where $\alpha$ is suitably large constant related to the implicit constants in the estimates (and thus dependent only upon $b_{0}$ and $\delta_{0}>0$ ).

Remark 10.3. We will show, assuming that (10.1) holds, that $\|v\|_{L_{[0, T]}^{\infty} H_{x}^{1}} \leq \frac{1}{2} \alpha \kappa h^{1 / 2}$ and thus by continuity we must have $T=T^{\prime}$.

In the remainder of the proof, we work on the time interval $[0, T]$, and we are able to assume that the orthogonality conditions (3.26) hold, $\delta_{0} \leq c_{1}(t) \leq c_{2}(t)-\delta_{0} \leq \delta_{0}^{-1}$, and that (10.1) holds. By Lemma 7.1 and Taylor expansion, we have (since $\kappa^{2} h^{4} \lesssim h^{2}$ )

$$
\left\{\begin{array}{l}
\dot{a}_{j}=c_{j}^{2}-b\left(a_{j}, t\right)+\mathcal{O}(h)  \tag{10.2}\\
\dot{c}_{j}=c_{j} \partial_{x} b\left(a_{j}, t\right)+\mathcal{O}\left(h^{2}\right),
\end{array}\right.
$$

with initial data $a_{j}(0)=\bar{a}_{j}, c_{j}(0)=\bar{c}_{j}$. Let

$$
\xi(t) \stackrel{\text { def }}{=} \frac{b\left(a_{1}(t), t\right)-b\left(a_{2}(t), t\right)}{a_{1}(t)-a_{2}(t)}
$$

and let $\Xi(t)$ denote an antiderivative. By the mean-value theorem $|\xi| \lesssim h$, and since $T \leq \omega h^{-1}$, we have $e^{\Xi} \sim 1$. We then have

$$
\frac{d}{d t}\left(e^{\Xi}\left(a_{2}-a_{1}\right)\right)=e^{\Xi}\left(c_{2}^{2}-c_{1}^{2}\right)+\mathcal{O}(h) .
$$

Since $\delta_{0}^{2} \leq c_{2}^{2}-c_{1}^{2}$, we see that $e^{\Xi}\left(a_{2}-a_{1}\right)$ is strictly increasing. Let $0 \leq t_{1} \leq T$ denote the unique time at which $e^{\Xi}\left(a_{2}-a_{1}\right)=0$ (if the quantity is always positive, take $t_{1}=0$, and if the quantity is always negative, take $t_{1}=T$, and make straightforward modifications to the argument below). If $t<t_{1}$, integrating from $t$ to $t_{1}$ we obtain

$$
\delta_{0}^{2}\left(t_{1}-t\right) \lesssim-e^{\Xi(t)}\left(a_{2}(t)-a_{1}(t)\right)=e^{\Xi(t)}\left|a_{2}(t)-a_{1}(t)\right|
$$

If $t>t_{1}$, integrating from $t_{1}$ to $t$ we obtain

$$
\delta_{0}^{2}\left(t-t_{1}\right) \lesssim e^{\Xi(t)}\left(a_{2}(t)-a_{1}(t)\right) .
$$

Hence,

$$
\int_{0}^{T}\left\langle a_{2}(t)-a_{1}(t)\right\rangle^{-2} \lesssim 1
$$

By Lemma 9.1, we conclude that

$$
\|v\|_{L_{T}^{\infty} H_{x}^{2}} \leq \frac{\alpha}{4}\left(\|v(0)\|_{H^{2}}+h^{2}\right) \leq \frac{\alpha}{4}\left(\kappa h^{2}+h^{2}\right) \leq \frac{1}{2} \alpha \kappa h^{2} .
$$

We can now complete
Proof of the main Theorem. Suppose that $\left\|v_{0}\right\|_{H^{2}} \leq h^{2}$. Iterate Prop. 10.1, as long as the condition

$$
\begin{equation*}
\delta_{0} \leq c_{1} \leq c_{2}-\delta_{0} \leq \delta_{0}^{-1} \tag{10.3}
\end{equation*}
$$

remains true, as follows: for the $k$-th iterate, put $\kappa=\alpha^{k}$ in Prop. 10.1 and advance from time $t_{k}=k \omega h^{-1}$ to time $t_{k+1}=(k+1) \omega h^{-1}$. At time $t_{k}$, we have $\left\|v\left(t_{k}\right)\right\|_{H^{2}} \leq$ $\alpha^{k} h^{2}$, and we find from Prop. 10.1 that $\|v\|_{L_{\left[t_{k}, t_{k+1}\right]} H_{x}^{2}} \leq \alpha^{k+1} h^{2}$. Provided (10.3) holds on all of $\left[0, t_{K}\right]$, we can continue until $\kappa^{-1} \sim h$, i.e. $K \sim \log h^{-1}$.

Recall (1.5), and $A_{j}(T), C_{j}(T)$ defined by (1.11). Let $\hat{a}_{j}(t)=h^{-1} A_{j}(h t), \hat{c}_{j}(t)=$ $C_{j}(h t)$. Then $\hat{a}_{j}, \hat{c}_{j}$ solve

$$
\left\{\begin{array}{l}
\dot{\hat{a}}_{j}=\hat{c}_{j}^{2}-b\left(\hat{a}_{j}, t\right) \\
\dot{\hat{c}}_{j}=\hat{c}_{j} \partial_{x} b\left(\hat{a}_{j}, t\right)
\end{array}\right.
$$

with initial data $\hat{a}_{j}(0)=\bar{a}_{j}, \hat{c}_{j}(0)=\bar{c}_{j}$. We know that (10.3) holds for $\hat{c}_{j}$ on $\left[0, h^{-1} T_{0}\right]$. Let $\tilde{a}_{j}=a_{j}-\hat{a}_{j}, \tilde{c}_{j}=c_{j}-\hat{c}_{j}$ denote the differences. Let

$$
\begin{gathered}
\gamma(t) \stackrel{\text { def }}{=} \frac{b\left(a_{j}, t\right)-b\left(\hat{a}_{j}, t\right)}{a_{j}-\hat{a}_{j}} \\
\sigma(t) \stackrel{\text { def }}{=} \frac{\partial_{x} b\left(a_{j}, t\right)-\partial_{x} b\left(\hat{a}_{j}, t\right)}{a_{j}-\hat{a}_{j}}
\end{gathered}
$$

By the mean-value theorem, $|\gamma(t)| \lesssim h$ and $|\sigma(t)| \lesssim h^{2}$. We have

$$
\left\{\begin{array}{l}
\dot{\tilde{a}}_{j}=\tilde{c}_{j}^{2}+2 \hat{c}_{j} \tilde{c}_{j}-\gamma \tilde{a}_{j}+\mathcal{O}(h)  \tag{10.4}\\
\dot{\tilde{c}}_{j}=\tilde{c}_{j}\left(\partial_{x} b\right)\left(a_{j}, t\right)+\hat{c}_{j} \sigma \tilde{a}_{j}+\mathcal{O}\left(h^{2}\right)
\end{array}\right.
$$

We conclude that $\left|\tilde{a}_{j}\right| \lesssim e^{C h t}$ and $\left|\tilde{c}_{j}\right| \lesssim h e^{C h t}$. This is proved by Gronwall's method and a bootstrap argument. Since (10.3) holds for $\hat{c}_{j}$ on $\left[0, h^{-1} T_{0}\right]$, it holds for $c_{j}$ on the same time scale if $T_{0}<\infty$, and up to the maximum time allowable by the above iteration argument, $\epsilon h^{-1} \log h^{-1}$, if $T_{0}=+\infty$.

## Appendix A. Local and global well-posedness

In this appendix, we will prove that (1.1) is globally well-posed in $H^{k}, k \geq 1$ provided

$$
\begin{equation*}
M(T) \stackrel{\text { def }}{=} \sum_{j=0}^{k+1}\left\|\partial_{x}^{j} b(x, t)\right\|_{L_{[0, T]}^{\infty}} L_{x}^{\infty}<\infty \tag{A.1}
\end{equation*}
$$

for all $T>0$. This is proved for $k=1$ under the additional assumption that $\|b\|_{L_{x}^{2} L_{T}^{\infty}}<\infty$ in the appendix of Dejak-Sigal [11]. $\ddagger$ The removal of the assumption $\|b\|_{L_{x}^{2} L_{T}^{\infty}}<\infty$ is convenient since it allows for us to consider potentials that asymptotically in $x$ converge to a nonzero number, rather than decay. Moreover, our argument is self-contained.

Well-posedness for KdV (nonlinearity $\partial_{x} u^{2}$ ) with $b \equiv 0$ was obtained by Bona-Smith [5] via the energy method, using the vanishing viscosity technique for construction and a regularization argument for uniqueness. Although their argument adapts to include $b \neq 0$ and to mKdV (1.1), it applies only for $k>\frac{3}{2}$ due to the derivative in the nonlinearity. Kenig-Ponce-Vega [21, 20] reduced the regularity requirements (for $b \equiv 0$ ) below $k=1$ by introducing new local smoothing and maximal function estimates and applying the contraction method. These estimates were obtained by Fourier analysis (Plancherel's theorem, van der Corput lemma). At the $H^{1}$ level of regularity (and above) for mKdV , the full strength of the maximal function estimate in $[21,20]$ is not needed. Here, we prove a local smoothing estimate and a (weak) maximal function estimate (see (A.2) and (A.3) in Lemma A. 1 below) instead by the integrating factor method, which easily accomodates the inclusion of a potential term since integration by parts can be applied. The estimates proved by Kenig-Ponce-Vega were directly applied by Dejak-Sigal, treating the potential term as a perturbation, which required introducing the norm $\|b\|_{L_{x}^{2} L_{T}^{\infty}}$. Our argument does not apply directly to KdV since we are lacking the (strong) maximal function estimate used by [21, 20].

Let $Q_{n}=\left[n-\frac{1}{2}, n+\frac{1}{2}\right]$ so that $\mathbb{R}=\cup Q_{n}$. Let $\tilde{Q}_{n}=[n-1, n+1]$. An example of our notation is:

$$
\|u\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}}=\sup _{n}\|u\|_{L_{(0, T)}^{2} L_{Q_{n}}^{2}} .
$$

We will use variants like $\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}$ etc. Note that due to the finite incidence of overlap, we have

$$
\|u\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \sim\|u\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}}^{2}
$$

[^1]Theorem A. 1 (local well-posedness). Take $k \in \mathbb{Z}, k \geq 1$. Suppose that

$$
M \stackrel{\text { def }}{=} \sum_{j=0}^{k+1}\left\|\partial_{x}^{j} b(x, t)\right\|_{L_{[0,1]}^{\infty} L_{x}^{\infty}}<\infty .
$$

For any $R \geq 1$, take

$$
T \lesssim \min \left(M^{-1}, R^{-4}\right)
$$

(1) If $\left\|u_{0}\right\|_{H^{k}} \leq R$, there exists a solution $u(t) \in C\left([0, T] ; H_{x}^{k}\right)$ to (1.1) on $[0, T]$ with initial data $u_{0}(x)$ satisfying

$$
\|u\|_{L_{T}^{\infty} H_{x}^{k}}+\left\|\partial_{x}^{k+1} u\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim R .
$$

(2) This solution $u(t)$ is unique among all solutions in $C\left([0, T] ; H_{x}^{1}\right)$.
(3) The data-to-solution map $u_{0} \mapsto u(t)$ is continuous as a mapping $H^{k} \rightarrow$ $C\left([0, T] ; H_{x}^{k}\right)$.

The main tool in the proof of Theorem A. 1 is the local smoothing estimate (A.2) below.

Lemma A.1. Suppose that

$$
v_{t}+v_{x x x}-(b v)_{x}=f .
$$

We have, for

$$
T \lesssim\left(1+\left\|b_{x}\right\|_{L_{T}^{\infty} L_{x}^{\infty}}+\|b\|_{L_{T}^{\infty} L_{x}^{\infty}}\right)^{-1}
$$

the energy and local smoothing estimates

$$
\|v\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|v_{x}\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim\left\|v_{0}\right\|_{L_{x}^{2}}+\left\{\begin{array}{l}
\left\|\partial_{x}^{-1} f\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}}  \tag{A.2}\\
\|f\|_{L_{T}^{1} L_{x}^{2}}
\end{array}\right.
$$

and the maximal function estimate

$$
\begin{equation*}
\|v\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\left\|v_{0}\right\|_{L_{x}^{2}}+T^{1 / 2}\|v\|_{L_{T}^{2} H_{x}^{1}}+T^{1 / 2}\|f\|_{L_{T}^{2} L_{x}^{2}} . \tag{A.3}
\end{equation*}
$$

The implicit constants are independent of $b$.
Proof. Let $\varphi(x)=-\tan ^{-1}(x-n)$, and set $w(x, t)=e^{\varphi(x)} v(x, t)$. Note that $0<e^{-\frac{\pi}{2}} \leq$ $e^{\varphi(x)} \leq e^{\frac{\pi}{2}}<\infty$, so the inclusion of this factor is harmless in the estimates, although has the benefit of generating the "local smoothing" term in (A.2). We have $\partial_{t} w+w_{x x x}-3 \varphi^{\prime} w_{x x}+3\left(-\varphi^{\prime \prime}+\left(\varphi^{\prime}\right)^{2}\right) w_{x}+\left(-\varphi^{\prime \prime \prime}+3 \varphi^{\prime \prime} \varphi^{\prime}-\left(\varphi^{\prime}\right)^{3}\right) w-(b w)_{x}+\varphi^{\prime} b w=e^{\varphi} f$.

This equation and manipulations based on integration by parts show that

$$
\begin{aligned}
\partial_{t}\|w\|_{L_{x}^{2}}= & 6\left\langle\varphi^{\prime}, w_{x}^{2}\right\rangle-3\left\langle\left(-\varphi^{\prime \prime}+\left(\varphi^{\prime}\right)^{2}\right)^{\prime}, w^{2}\right\rangle+2\left\langle-\varphi^{\prime \prime \prime}+3 \varphi^{\prime \prime} \varphi^{\prime}-\left(\varphi^{\prime}\right)^{3}, w^{2}\right\rangle \\
& -\left\langle b_{x}, w^{2}\right\rangle+2\left\langle b \varphi^{\prime}, w^{2}\right\rangle+2\left\langle w, e^{\varphi} f\right\rangle
\end{aligned}
$$

We integrate the above identity over $[0, T]$, move the smoothing term $6 \int_{0}^{T}\left\langle\varphi^{\prime}, w_{x}^{2}\right\rangle_{x} d t$ over to the left side, and estimate the remaining terms to obtain:

$$
\begin{aligned}
& \|w(T)\|_{L_{x}^{2}}^{2}+6\left\|\langle x-n\rangle^{-1} w_{x}\right\|_{L_{T}^{2} L_{x}^{2}}^{2} \\
& \quad \leq\left\|w_{0}\right\|_{L_{x}^{2}}^{2}+C T\left(1+\left\|b_{x}\right\|_{L_{T}^{\infty} L_{x}^{\infty}}+\|b\|_{L_{T}^{\infty} L_{X}^{\infty}}\right)\|w\|_{L_{T}^{\infty} L_{x}^{2}}^{2}+C \int_{0}^{T}\left|\int e^{\varphi} f w d x\right| d t
\end{aligned}
$$

Replacing $T$ by $T^{\prime}$, and taking the supremum over $T^{\prime} \in[0, T]$, we obtain, for $T \lesssim$ $\left(1+\left\|b_{x}\right\|_{L_{T}^{\infty} L_{x}^{\infty}}+\|b\|_{L_{[0, T]}^{\infty}} L_{x}^{\infty}\right)^{-1}$, the estimate

$$
\|w\|_{L_{T}^{\infty} L_{x}^{2}}^{2}+\left\|\langle x-n\rangle^{-1} w_{x}\right\|_{L_{T}^{2} L_{x}^{2}}^{2} \lesssim\left\|w_{0}\right\|_{L_{x}^{2}}^{2}+\int_{0}^{T}\left|\int e^{\varphi} f w d x\right| d t
$$

Using that $0<e^{-\pi / 2} \leq e^{\varphi} \leq e^{\pi / 2}<\infty$, this estimate can be converted back to an estimate for $v$ :

$$
\|v\|_{L_{T}^{\infty} L_{x}^{2}}^{2}+\left\|v_{x}\right\|_{L_{T}^{2} L_{Q_{n}}^{2}}^{2} \lesssim\left\|v_{0}\right\|_{L_{x}^{2}}^{2}+\int_{0}^{T}\left|\int e^{2 \varphi} f v d x\right| d t
$$

Estimating as

$$
\int_{0}^{T}\left|\int e^{2 \varphi} f v d x\right| d t \lesssim\|f\|_{L_{T}^{1} L_{x}^{2}}\|v\|_{L_{T}^{\infty} L_{x}^{2}}
$$

and then taking the supremum in $n$ yields the second bound in (A.2). Estimating instead as:

$$
\begin{aligned}
\int_{0}^{T}\left|\int e^{2 \varphi} f v d x\right| d t & =\int_{0}^{T}\left|\int e^{2 \varphi}\left(\partial_{x} \partial_{x}^{-1} f\right) v d x\right| d t \\
& \leq \int_{0}^{T}\left|\int\left(\partial_{x}^{-1} f\right) \partial_{x}\left(e^{2 \varphi} v\right) d x\right| d t \\
& \leq \sum_{m}\left\|\partial_{x}^{-1} f\right\|_{L_{T}^{2} L_{Q_{m}}^{2}}\left\|\left\langle\partial_{x}\right\rangle v\right\|_{L_{T}^{2} L_{Q_{m}}^{2}} \\
& \leq\left\|\partial_{x}^{-1} f\right\|_{\ell_{m}^{1} L_{T}^{2} L_{Q_{m}}^{2}}\left\|\left\langle\partial_{x}\right\rangle v\right\|_{\ell_{m}^{\infty} L_{T}^{2} L_{Q_{m}}^{2}}
\end{aligned}
$$

and taking the supremum in $n$ yields the second bound in (A.2).
For the estimate (A.3), we take $\psi(x)=1$ on $\left[n-\frac{1}{2}, n+\frac{1}{2}\right]$ and 0 outside $[n-1, n+1]$, set $w=\psi v$, and compute, similarly to the above,

$$
\|v\|_{L_{T}^{\infty} L_{Q_{n}}^{2}}^{2} \lesssim\left\|v_{0}\right\|_{L_{Q_{n}}^{2}}^{2}+T\left\|v_{x}\right\|_{L_{T}^{2} L_{Q_{n}}^{2}}^{2}+T\|f\|_{L_{T}^{2} L_{Q_{n}}^{2}}^{2}
$$

The proof is completed by summing in $n$.
Proof of Theorem A.1. We prove the existence by contraction in the space $X$, where

$$
X=\left\{u \mid\|u\|_{C\left([0, T] ; H_{x}^{k}\right)}+\left\|\partial_{x}^{k+1} u\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}}+\sup _{\alpha \leq k-1}\left\|\partial_{x}^{\alpha} u\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \leq C R\right\}
$$

Here $C$ is just chosen large enough to exceed the implicit constant in (A.2). Given $u \in X$, let $\varphi(u)$ denote the solution to

$$
\begin{equation*}
\partial_{t} \varphi(u)+\partial_{x}^{3} \varphi(u)-\partial_{x}(b \varphi(u))=-2 \partial_{x}\left(u^{3}\right) . \tag{A.4}
\end{equation*}
$$

with initial condition $\varphi(u)(0)=u_{0}$. A fixed point $\varphi(u)=u$ in $X$ will solve (1.1). We separately treat the case $k=1$ for clarity of exposition.
Case $k=1$. Applying $\partial_{x}$ to (A.4) gives, with $v=\varphi(u)_{x}$,

$$
v_{t}+v_{x x x}-(b v)_{x}=-2\left(u^{3}\right)_{x x}+\left(b_{x} \varphi(u)\right)_{x} .
$$

Now, (A.2) gives

$$
\begin{align*}
& \left\|\varphi(u)_{x}\right\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|\varphi(u)_{x x}\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim \\
& \quad\left\|u_{0}\right\|_{H_{x}^{1}}+\left\|\left(u^{3}\right)_{x}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}}+\left\|\left(b_{x} \varphi(u)\right)_{x}\right\|_{L_{T}^{1} L_{x}^{2}} \tag{A.5}
\end{align*}
$$

Using that $\|u\|_{L_{Q}^{\infty}}^{2} \lesssim\left(\|u\|_{L_{\overparen{Q}}^{2}}+\left\|u_{x}\right\|_{L_{\overparen{Q}}^{2}}\right)\|u\|_{L_{\widetilde{Q}}^{2}}$, we also have

$$
\left\|\left(u^{3}\right)_{x}\right\|_{L_{Q}^{2}} \lesssim\left\|u_{x}\right\|_{L_{Q}^{2}}\|u\|_{L_{Q}^{\infty}}^{2} \lesssim\left\|u_{x}\right\|_{L_{Q}^{2}}^{2}\|u\|_{L_{\widetilde{Q}}^{2}}\left(\|u\|_{L_{\widetilde{Q}}^{2}}+\left\|u_{x}\right\|_{L_{\overparen{Q}}^{2}}\right) .
$$

Taking the $L_{T}^{2}$ norm and applying the Hölder inequality, we obtain

$$
\left\|\left(u^{3}\right)_{x}\right\|_{L_{T}^{2} L_{Q}^{2}} \lesssim\left\|u_{x}\right\|_{L_{T}^{\infty} L_{Q}^{2}}\|u\|_{L_{T}^{\infty} L_{\overparen{Q}}^{2}}\left(\|u\|_{L_{T}^{2} L_{\overparen{Q}}^{2}}+\left\|u_{x}\right\|_{L_{T}^{2} L_{\overparen{Q}}^{2}}\right)
$$

Taking the $\ell_{n}^{1}$ norm and applying the Hölder inequality again yields

$$
\left\|\left(u^{3}\right)_{x}\right\|_{\ell^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim\left\|u_{x}\right\|_{\ell_{n}^{\infty} L_{T}^{\infty} L_{Q_{n}}^{2}}\|u\|_{\ell_{n}^{2} L_{T}^{\infty} L_{\hat{Q}_{n}}^{2}}\left(\|u\|_{\ell_{n}^{2} L_{T}^{2} L_{\widehat{Q}_{n}}^{2}}+\left\|u_{x}\right\|_{\ell_{n}^{2} L_{T}^{2} L_{\widehat{Q}_{n}}^{2}}\right)
$$

Using the straightforward bounds $\left\|u_{x}\right\|_{\ell_{n}^{\infty} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\left\|u_{x}\right\|_{L_{T}^{\infty} L_{x}^{2}}$,

$$
\|u\|_{\ell_{n}^{2} L_{T}^{2} L_{\tilde{Q}_{n}}^{2}} \lesssim\|u\|_{L_{T}^{2} L_{x}^{2}} \lesssim T^{1 / 2}\|u\|_{L_{T}^{\infty} L_{x}^{2}}
$$

and

$$
\left\|u_{x}\right\|_{\ell_{n}^{2} L_{T}^{2} L_{\mathscr{Q}_{n}}^{2}} \lesssim\left\|u_{x}\right\|_{L_{T}^{2} L_{x}^{2}} \lesssim T^{1 / 2}\left\|u_{x}\right\|_{L_{T}^{\infty} L_{x}^{2}}
$$

we obtain

$$
\left\|\left(u^{3}\right)_{x}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim T^{1 / 2}\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{2}\|u\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} .
$$

Inserting these bounds into (A.5),

$$
\begin{align*}
\left\|\varphi(u)_{x}\right\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|\varphi(u)_{x x}\right\|_{\ell n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2} & \left\|u_{0}\right\|_{H_{x}^{1}}+T^{1 / 2}\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{2}\|u\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}  \tag{A.6}\\
& +T\left(\left\|b_{x}\right\|_{L_{x}^{\infty}}+\left\|b_{x x}\right\|_{L_{x}^{\infty}}\right)\|\varphi(u)\|_{H_{x}^{1}} .
\end{align*}
$$

The local smoothing estimate (A.2) applied to $v=\varphi(u)$ (not $v=\varphi(u)_{x}$ as above), and the estimate

$$
\left\|\left(u^{3}\right)_{x}\right\|_{L_{T}^{1} L_{x}^{2}} \lesssim T\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3}
$$

provides the estimate

$$
\begin{equation*}
\|\varphi(u)\|_{L_{T}^{\infty} L_{x}^{2}} \lesssim T\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3} \tag{A.7}
\end{equation*}
$$

The maximal function estimate (A.3) applied to $v=\varphi(u)$ and the estimate

$$
\left\|\left(u^{3}\right)_{x}\right\|_{L_{T}^{2} L_{x}^{2}} \lesssim T^{1 / 2}\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3}
$$

give the estimate

$$
\begin{equation*}
\|\varphi(u)\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\left\|u_{0}\right\|_{L_{x}^{2}}+T\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{1}}+T\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3} . \tag{A.8}
\end{equation*}
$$

Summing (A.6), (A.7), (A.8), we obtain that $\|\varphi(u)\|_{X} \leq C R$ if $\|u\|_{X} \leq C R$ provided $T$ is as stated above. Thus $\varphi: X \rightarrow X$. A similar argument establishes that $\varphi$ is a contraction on $X$.
Case $k \geq 2$. Differentiating (A.4) $k$ times with respect to $x$ we obtain, with $v=$ $\partial_{x}^{k} \varphi(u)$,

$$
\partial_{t} v+\partial_{x}^{3} v-\partial_{x}(b v)=-2 \partial_{x}^{k+1}\left(u^{3}\right)-2 \partial_{x} \sum_{\substack{\alpha+\beta \leq k+1 \\ \beta \leq k-1}} \partial_{x}^{\alpha} b \partial_{x}^{\beta} \varphi(u)
$$

Using (A.2) gives

$$
\begin{gathered}
\left\|\partial_{x}^{k} \varphi(u)\right\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|\partial_{x}^{k+1} \varphi(u)\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim \\
\left\|\partial_{x}^{k} u^{3}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}}+\sup _{\substack{\alpha+\beta \leq k+1 \\
\beta \leq k-1}}\left\|\partial_{x}\left(\partial_{x}^{\alpha} b \partial_{x}^{\beta} \varphi(u)\right)\right\|_{L_{T}^{1} L_{x}^{2}}
\end{gathered}
$$

Expanding, and applying Leibniz rule gives

$$
\partial_{x}^{k} u=\sum_{\substack{\alpha+\beta+\gamma=k \\ \alpha \leq \beta \leq \gamma}} c_{\alpha \beta \gamma} \partial_{x}^{\alpha} u \partial_{x}^{\beta} u \partial_{x}^{\gamma} u
$$

which is then estimated as follows

$$
\left\|\partial_{x}^{k} u\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim \sum_{\substack{\alpha+\beta+\gamma=k \\ \alpha \leq \beta \leq \gamma}}\left\|\partial_{x}^{\alpha} u\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{\infty}}\left\|\partial_{x}^{\beta} u\right\|_{\ell_{n}^{2} L_{T}^{2} L_{Q_{n}}^{\infty}}\left\|\partial_{x}^{\gamma} u\right\|_{\ell_{n}^{\infty} L_{T}^{\infty} L_{Q_{n}}^{2}}
$$

By the Sobolev embedding theorem (as in the $k=1$ case) we obtain

$$
\left\|\partial_{x}^{k} u^{3}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim \sum_{\substack{\alpha+\beta+\gamma=k \\ \alpha \leq \beta \leq \gamma}}\left(\sup _{\sigma \leq \alpha+1}\left\|\partial_{x}^{\sigma} u\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}\right)\left(\sup _{\sigma \leq \beta+1}\left\|\partial_{x}^{\sigma} u\right\|_{\ell_{n}^{2} L_{T}^{2} L_{Q_{n}}^{2}}\right)\left\|\partial_{x}^{\gamma} u\right\|_{L_{T}^{\infty} L_{x}^{2}}
$$

When $k \geq 2$, we have $\alpha \leq\left[\left[\frac{1}{3} k\right]\right] \leq k-2$ and $\beta \leq\left[\left[\frac{1}{2} k\right]\right] \leq k-1$, and therefore

$$
\left\|\partial_{x}^{k} u^{3}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim T^{1 / 2}\left(\sup _{\alpha \leq k-1}\left\|\partial_{x}^{\alpha} u\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}\right)\|u\|_{L_{T}^{\infty} H_{x}^{k}}^{2}
$$

Also,

$$
\left\|\partial_{x}\left(\partial_{x}^{\alpha} b \partial_{x}^{\beta} \varphi(u)\right)\right\|_{L_{T}^{1} L_{x}^{2}} \leq T\left(\sup _{\alpha \leq k+1}\left\|\partial_{x}^{\alpha} b\right\|_{L_{T}^{\infty} L_{x}^{\infty}}\right)\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{k}}
$$

Combining these estimates, we obtain

$$
\begin{gather*}
\left\|\partial_{x}^{k} \varphi(u)\right\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|\partial_{x}^{k+1} \varphi(u)\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim\left\|u_{0}\right\|_{H_{x}^{k}}  \tag{A.9}\\
+T^{1 / 2}\left(\sup _{\alpha \leq k-1}\left\|\partial_{x}^{\alpha} u\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}\right)\|u\|_{L_{T}^{\infty} H_{x}^{k}}^{2}+T\left(\sup _{\alpha \leq k+1}\left\|\partial_{x}^{\alpha} b\right\|_{L_{T}^{\infty} L_{x}^{\infty}}\right)\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{k}}
\end{gather*}
$$

The local smoothing $\left\|\left(u^{3}\right)_{x}\right\|_{L_{T}^{1} L_{x}^{2}} \lesssim T\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3}$ to obtain

$$
\begin{equation*}
\|\varphi(u)\|_{L_{T}^{\infty} L_{x}^{2}} \lesssim T\|u\|_{L_{T}^{\infty} H_{x}^{1}}^{3} \tag{A.10}
\end{equation*}
$$

We apply the maximal function estimate (A.3) to $v=\partial_{x}^{\alpha} \varphi(u)$ for $\alpha \leq k-1$ and use that $\left\|\partial_{x}^{\alpha+1} u^{3}\right\|_{L_{T}^{1} L_{x}^{2}} \leq T\|u\|_{L_{T}^{\infty} H_{x}^{k}}^{3}$ and

$$
\left\|\partial_{x}^{\alpha+1}(b \varphi(u))\right\|_{L_{T}^{1} L_{x}^{2}} \leq T\left(\sup _{\beta \leq k}\left\|\partial_{x}^{\beta} b\right\|_{L_{T}^{\infty} L_{x}^{\infty}}\right)\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{k}}
$$

to obtain

$$
\begin{align*}
\left\|\partial_{x}^{\alpha} \varphi(u)\right\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim & \left\|u_{0}\right\|_{H_{x}^{k-1}}+T\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{k}}+T\|u\|_{L_{T}^{\infty} H_{x}^{k}}^{3}  \tag{A.11}\\
& +T\left(\sup _{\beta \leq k}\left\|\partial_{x}^{\beta} b\right\|_{L_{T}^{\infty} L_{x}^{\infty}}\right)\|\varphi(u)\|_{L_{T}^{\infty} H_{x}^{k}}
\end{align*}
$$

Summing (A.9), (A.10), (A.11), we obtain that $\varphi: X \rightarrow X$, and a similar argument shows that $\varphi$ is a contraction. This concludes the case $k \geq 2$.

To establish uniqueness within the broader class of solutions belonging merely to $C\left([0, T] ; H_{x}^{1}\right)$, we argue as follows. Suppose $u, v \in C\left([0, T] ; H_{x}^{1}\right)$ solve (1.1). By (A.3),

$$
\|v\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\left\|v_{0}\right\|_{L^{2}}+T\|v\|_{L_{T}^{\infty} H_{x}^{1}}+T\|v\|_{L_{T}^{\infty} H_{x}^{1}}^{3} .
$$

By taking $T$ small enough in terms of $\|v\|_{L_{T}^{\infty} H_{x}^{1}}$, we have that

$$
\begin{equation*}
\|v\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\|v\|_{L_{T}^{\infty} H_{x}^{1}} . \tag{A.12}
\end{equation*}
$$

Similarly,

$$
\begin{equation*}
\|u\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim\|u\|_{L_{T}^{\infty} H_{x}^{1}} . \tag{A.13}
\end{equation*}
$$

Set $w=u-v$. Then, with $g=\left(u^{3}-v^{3}\right) /(u-v)=u^{2}+u v+v^{2}$, we have

$$
w_{t}+w_{x x x}-(b w)_{x} \pm(g w)_{x}=0 .
$$

Apply (A.2) to $v=w_{x}$ to obtain

$$
\begin{equation*}
\left\|w_{x}\right\|_{L_{T}^{\infty} L_{x}^{2}}+\left\|w_{x x}\right\|_{\ell_{n}^{\infty} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim\left\|(g w)_{x}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}}+\left\|\left(b_{x} w\right)_{x}\right\|_{L_{T}^{1} L_{x}^{2}} \tag{A.14}
\end{equation*}
$$

The terms of $\left\|(g w)_{x}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}}$ are bounded following the method used above:

$$
\begin{aligned}
\left\|u_{x} v w\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} & \lesssim\left\|u_{x}\right\|_{\ell_{n}^{\infty} L_{T}^{\infty} L_{Q_{n}}^{2}}\|v w\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{\infty}} \\
& \lesssim\left\|u_{x}\right\|_{\ell_{n}^{\infty} L_{T}^{\infty} L_{Q_{n}}^{2}}\left(\|v w\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{1}}+\left\|(v w)_{x}\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{1}}\right)
\end{aligned}
$$

The term in parentheses is bounded by

$$
\|v\|_{\ell_{n}^{2} L_{T}^{2} L_{Q_{n}}^{2}}\|w\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}+\left\|v_{x}\right\|_{\ell_{n}^{2} L_{T}^{2} L_{Q_{n}}^{2}}\|w\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}+\|v\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}\left\|w_{x}\right\|_{\ell_{n}^{2} L_{T}^{2} L_{Q_{n}}^{2}}
$$

which leads to the bound

$$
\begin{equation*}
\left.\left\|u_{x} v w\right\|_{\ell_{n}^{1} L_{T}^{2} L_{Q_{n}}^{2}} \lesssim T^{1 / 2}\|u\|_{L_{T}^{\infty} H_{x}^{1}}\|v\|_{L_{T}^{\infty} H_{x}^{1}}\|w\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}+\|v\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}\|w\|_{L_{T}^{\infty} H_{x}^{1}}\right) \tag{A.15}
\end{equation*}
$$

We now allow implicit constants to depend upon $\|u\|_{L_{T}^{\infty} H_{x}^{1}}$ and $\|v\|_{L_{T}^{\infty} H_{x}^{1}}$. Appealing to (A.14), (A.15) (and analogous estimates for other terms in $g w$ ), (A.12), (A.13) to obtain

$$
\|w\|_{L_{T}^{\infty} H_{x}^{1}} \lesssim T^{1 / 2}\left(\|w\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}}+\|w\|_{L_{T}^{\infty} H_{x}^{1}}\right)
$$

Combining this estimate with the maximal function estimate (A.3) applied to $w$ yields

$$
\|w\|_{\ell_{n}^{2} L_{T}^{\infty} L_{Q_{n}}^{2}} \lesssim T^{1 / 2}\|w\|_{L_{T}^{\infty} H_{x}^{1}}+T\|g\|_{L_{T}^{\infty} H_{x}^{1}}\|w\|_{L_{T}^{\infty} H_{x}^{1}}
$$

This gives $w \equiv 0$ for $T$ sufficiently small. The continuity of the data-to-solution map is proved using similar arguments.

Next, we prove global well-posedness in $H^{k}$ by proving a priori bounds. Theorem A. 1 shows that doing it suffices for global well-posedness

Theorem A. 2 (global well-posedness). Fix $k \geq 1$ and suppose $M(T)<\infty$ for all $T \geq 0$, where $M(T)$ is defined in (A.1). For $u_{0} \in H^{k}$, there is a unique global solution $u \in C_{l o c}\left([0,+\infty) ; H_{x}^{k}\right)$ to (1.1) with $\|u\|_{L_{T}^{\infty} H_{x}^{k}}$ controlled by $\left\|u_{0}\right\|_{H^{k}}, T$, and $M(T)$.
Proof. Before beginning, we note that by the Gagliaro-Nirenberg inequality, $\|u\|_{L^{4}}^{4} \lesssim$ $\|u\|_{L^{2}}^{3}\left\|u_{x}\right\|_{L^{2}}$, we have (in the focusing case)

$$
\left\|u_{x}\right\|_{L^{2}}^{2}-\left\|u_{x}\right\|\|u\|_{L^{2}}^{3} \leq I_{3}(u) \leq\left\|u_{x}\right\|_{L^{2}}^{2} .
$$

With $\alpha=\left\|u_{x}\right\|_{L^{2}}^{2} /\|u\|_{L^{2}}^{6}$ and $\beta=I_{3}(u) /\|u\|_{L^{2}}^{6}$, this is $\alpha-\alpha^{1 / 2} \leq \beta \leq \alpha$, which implies that $\langle\alpha\rangle \sim\langle\beta\rangle$, i.e.

$$
\left\|u_{x}\right\|_{L^{2}}^{2}+\|u\|_{L^{2}}^{6} \sim I_{3}(u)+\|u\|_{L^{2}}^{6}
$$

The same statement holds in the defocusing case.
Another fact we need is based on the

$$
\begin{aligned}
\frac{d}{d t} I_{j}(u) & =\left\langle I_{j}^{\prime}(u), \partial_{t} u\right\rangle \\
& =\left\langle I_{j}^{\prime}(u),-u_{x x x}-2\left(u^{3}\right)_{x}+(b u)_{x}\right\rangle \\
& =\left\langle I_{j}^{\prime}(u), \partial_{x} I_{3}^{\prime}(u)\right\rangle+\left\langle I_{j}^{\prime}(u),(b u)_{x}\right\rangle \\
& =\left\langle I_{j}^{\prime}(u),(b u)_{x}\right\rangle
\end{aligned}
$$

For $u(t) \in L^{2}$, we compute near conservation of momentum and energy from Lemma 2.1:

$$
\frac{d}{d t} I_{1}(u)=\left\langle b_{x}, A_{1}(u)\right\rangle
$$

Estimate $\left|\left\langle b_{x}, A_{1}(u)\right\rangle\right| \leq\left\|b_{x}\right\|_{L^{\infty}} I_{1}(u)$, and apply Gronwall to obtain a bound on $\|u\|_{L_{T}^{\infty} L_{x}^{2}}$ in terms of $\left\|b_{x}\right\|_{L_{T}^{\infty} L^{\infty}}$ and $\left\|u_{0}\right\|_{L^{2}}$. For $u(t) \in H^{1}$, we compute near conservation of energy from Lemma 2.1:

$$
\frac{d}{d t} I_{3}(u)=3\left\langle b_{x}, A_{3}(u)\right\rangle-\left\langle b_{x x x}, A_{1}(u)\right\rangle
$$

We have

$$
\begin{aligned}
\left|\left\langle b_{x}, A_{3}(u)\right\rangle\right| & \lesssim\left\|b_{x}\right\|_{L^{\infty}}\left(\left\|u_{x}\right\|_{L^{2}}^{2}+\|u\|_{L^{4}}^{4}\right) \\
& \lesssim\left\|b_{x}\right\|_{L^{\infty}}\left(\left\|u_{x}\right\|_{L^{2}}^{2}+\left\|u_{x}\right\|_{L^{2}}\|u\|_{L^{2}}^{3}\right) \\
& \lesssim\left\|b_{x}\right\|_{L^{\infty}}\left(\left\|u_{x}\right\|_{L^{2}}^{2}+\|u\|_{L^{2}}^{6}\right) \\
& \lesssim\left\|b_{x}\right\|_{L^{\infty}}\left(I_{3}(u)+\|u\|_{L^{2}}^{6}\right)
\end{aligned}
$$

and

$$
\left|\left\langle b_{x x x}, A_{1}(u)\right\rangle\right| \lesssim\left\|b_{x x x}\right\|_{L^{\infty}}\|u\|_{L^{2}}^{2} .
$$

Combining these gives

$$
\left|\frac{d}{d t} I_{3}(u)\right| \lesssim\left\|b_{x}\right\|_{L^{\infty}} I_{3}(u)+\left\|b_{x}\right\|_{L^{\infty}}\|u\|_{L^{2}}^{6}+\left\|b_{x x x}\right\|_{L^{\infty}}\|u\|_{L^{2}}^{2}
$$

Gronwall's inequality, combined with the previous bound on $\|u\|_{L^{2}}$, gives the bound on $I_{3}(u)$ and hence $\|u\|_{H^{1}}$.

For $u(t) \in H^{2}$, we apply Lemma 2.1 to obtain

$$
\begin{aligned}
\frac{d}{d t} I_{5}(u) & =\left\langle I_{5}^{\prime}(u),(b u)_{x}\right\rangle \\
& =5\left\langle b_{x}, A_{5}(u)\right\rangle-5\left\langle b_{x x x}, A_{3}(u)\right\rangle+\left\langle b_{x x x x x}, A_{1}(u)\right\rangle
\end{aligned}
$$

We have

$$
\begin{aligned}
\left|\left\langle b_{x}, A_{5}(u)\right\rangle\right| & \lesssim\left\|b_{x}\right\|_{L^{\infty}}\left(\left\|u_{x x}\right\|_{L^{2}}^{2}+\|u\|_{H^{1}}^{4}+\|u\|_{H^{1}}^{6}\right) \\
& \lesssim\left\|b_{x}\right\|_{L^{\infty}} I_{5}(u)+\left\|b_{x}\right\|_{L^{\infty}}\left(\|u\|_{H^{1}}^{4}+\|u\|_{H^{1}}^{6}\right)
\end{aligned}
$$

Also,

$$
\left|\left\langle b_{x x x}, A_{3}(u)\right\rangle\right| \lesssim\left\|b_{x x x}\right\|_{L^{\infty}}\left(\|u\|_{H^{1}}^{2}+\|u\|_{H^{1}}^{4}\right)
$$

and

$$
\left|\left\langle b_{x x x x x}, A_{1}(u)\right\rangle\right| \lesssim\left\|b_{x x x}\right\|_{L^{\infty}}\left\|\left(u^{2}\right)_{x x}\right\|_{L^{2}} \lesssim\left\|b_{x x x}\right\|_{L^{\infty}}\|u\|_{H^{2}}\|u\|_{L^{2}}
$$

Combining, applying Gronwall's inequality, and appealing to the bound on $\|u\|_{H^{1}}$ obtained previously, we obtain the claimed a priori bound in the case $k=2$.

Bounds on $H^{k}$ for $k \geq 3$ can be obtained by the above method appealing to higherorder analogues of the identities in Lemma 2.1. However, starting with $k=3$, we do not need such refined information. By direct computation from (1.1),

$$
\frac{d}{d t}\left\|\partial_{x}^{k} u\right\|_{L^{2}}^{2}=-\int \partial_{x}^{k+1}(b u) \partial_{x}^{k} u+2 \int \partial_{x}^{k+1} u^{3} \partial_{x}^{k} u
$$

In the Leibniz expansion of $\partial_{x}^{k+1} u^{3}$, we isolate two cases:

$$
\partial_{x}^{k+1} u^{3}=3 u^{2} \partial_{x}^{k+1} u+\sum_{\substack{\alpha+\beta+\gamma=k+1 \\ \alpha \leq \beta \leq \gamma \leq k}} c_{\alpha \beta \gamma} \partial_{x}^{\alpha} u \partial_{x}^{\beta} u \partial_{x}^{\gamma} u
$$

For the first term,

$$
\left|\int u^{2} \partial_{x}^{k+1} u \partial_{x}^{k} u\right|=\left|\int\left(u^{2}\right)_{x}\left(\partial_{x}^{k} u\right)^{2}\right| \lesssim\|u\|_{H^{2}}^{2}\|u\|_{H^{k}}^{2}
$$

By the Hölder's inequality and interpolation, if $\alpha+\beta+\gamma=k+1$ and $\gamma \leq k$,

$$
\left\|\partial_{x}^{\alpha} u \partial_{x}^{\beta} u \partial_{x}^{\gamma} u\right\|_{L^{2}} \lesssim\|u\|_{H^{2}}^{2}\|u\|_{H^{k}}
$$

Thus we have

$$
\left|\int \partial_{x}^{k+1} u^{3} \partial_{x}^{k} u\right| \lesssim\|u\|_{H^{2}}^{2}\|u\|_{H^{k}}^{2}
$$

Similarly, we can bound

$$
\left|\int \partial_{x}^{k+1}(b u) \partial_{x}^{k} u\right| \lesssim M(t)\|u\|_{H^{k}}^{2}
$$

by separately considering the term $b \partial_{x}^{k+1} u \partial_{x}^{k} u$ and integrating by parts. We obtain

$$
\left|\frac{d}{d t}\left\|\partial_{x}^{k} u\right\|_{L^{2}}^{2}\right| \lesssim\left(M+\|u\|_{H^{2}}^{2}\right)\|u\|_{H^{k}}^{2}
$$

and can apply the Gronwall inequality to obtain the desired a priori bound.

## Appendix B. Comments about the effective ODEs

Here we make some comments about the differential equations for the parameters $a$ and $c$.
B.1. Conditions on $T_{0}$. First we give a reason for replacing $T_{0}(h)$ in the definition of $T(h)$ (1.5) by $T_{0}$ defined by (1.12). In (10.2) we have seen that the $a$ and $c$ solving the system (1.4) give the following equations for $\widetilde{A}=h a, \widetilde{C}=c, T=h t$ :

$$
\left\{\begin{array}{l}
\partial_{T} \widetilde{A}_{j}=\widetilde{C}_{j}^{2}-b_{0}\left(\widetilde{A}_{j}, T\right)+\mathcal{O}(h) \\
\partial_{T} \widetilde{C}_{j}=\widetilde{C}_{j} \partial_{x} b_{0}\left(\widetilde{A}_{j}, T\right)+\mathcal{O}(h)
\end{array}, \quad \widetilde{A}(0)=\bar{a} h, \quad \widetilde{C}(0)=\bar{c}, \quad j=1,2\right.
$$

This can also be seen by analysing (B.6) using Lemma 3.2.
As in (10.4) we can write the equations for $\widetilde{A}_{j}-A_{j}$ and $\widetilde{C}_{j}-C_{j}$ :

$$
\left\{\begin{array}{l}
\partial_{T}\left(\widetilde{A}_{j}-A_{j}\right)=\left(\widetilde{C}_{j}-C_{j}\right)^{2}+2 C_{j}\left(\widetilde{C}_{j}-C_{j}\right)+\gamma_{0}\left(\widetilde{A}_{j}-A_{j}\right)+\mathcal{O}(h) \\
\partial_{T}\left(\widetilde{C}_{j}-C_{j}\right)=\left(\widetilde{C}_{j}-C_{j}\right)\left(\partial_{x} b_{0}\right)\left(A_{j}, t\right)+C_{j} \sigma_{0}\left(\widetilde{A}_{j}-A_{j}\right)+\mathcal{O}(h) \\
\widetilde{A}_{j}(0)-A_{j}(0)=0, \quad \widetilde{C}_{j}(0)-C_{j}(0)=0
\end{array}\right.
$$

where $\gamma_{0}, \sigma_{0}=\mathcal{O}(1)$. This implies that

$$
\left\{\begin{array}{l}
\widetilde{A}_{j}(T)-A_{j}(T)=\mathcal{O}(h) e^{C T} \\
\widetilde{C}_{j}(T)-C_{j}(T)=\mathcal{O}(h) e^{C T}
\end{array}\right.
$$

This means that for $T<\delta \log (1 / h)$, we have $C_{j}(T)=\widetilde{C}_{j}(T)+\mathcal{O}\left(h^{1-\delta C}\right)$. Hence, if $\delta$ is small enough, then for small $h$ we have that $T_{0}(h)$ defined in (1.5) and $T_{0}$ in (1.12) can be interchanged.
B.2. Examples with $C_{j}$ going to 0 . In the decoupled equations (1.11) we can have

$$
C_{j}(T) \rightarrow 0, \quad T \rightarrow \infty
$$

which implies that $T_{0}<\infty$ in the definition (1.12). That prevents $\log (1 / h) / h$ lifespan of the approximation (1.3).

Let us put

$$
a=A_{j}, \quad c=C_{j},
$$

so that the system (1.11) becomes

$$
\begin{equation*}
a_{T}^{\prime}=c^{2}(T)-b_{0}(a, T), \quad c_{T}^{\prime}=c \partial_{a} b_{0}(a, T) . \tag{B.1}
\end{equation*}
$$

For simplicity we consider the case of $b_{0}(a, T)=b_{0}(a)$. In that case the Hamiltonian

$$
E(a, c)=-\frac{1}{3} c^{3}+c b_{0}(a)
$$

is conserved in the evolution and we have

$$
\begin{equation*}
\exp \left(T \min \partial_{a} b\right) \leq|c(T)| \leq \exp \left(T \max \partial_{a} b\right) \tag{B.2}
\end{equation*}
$$

In particular this means that $c>\delta>0$ if $T<T_{1}(\delta)$.
We cannot improve on (B.2), and in general we may have

$$
|c(T)| \leq e^{-\gamma T}, \quad T \rightarrow \infty
$$

but this behaviour is rare. First we note that the conservation of $E$ shows that if $c\left(T_{j}\right) \rightarrow 0$ for some sequence $T_{j} \rightarrow \infty$, then $E=0$. We can then solve for $c$, and the equation reduces to $d a / d T=2 b_{0}(a), c^{2}=3 b_{0}(a)$, that is to

$$
\begin{equation*}
\frac{1}{2} \int_{a_{0}}^{a} \frac{d \tilde{a}}{b_{0}(\tilde{a})}=T, \quad b(a(0))>0 \tag{B.3}
\end{equation*}
$$

If $b_{0}(a)>0$ in this set of values $a$ then

$$
\begin{equation*}
a(T) \rightarrow \infty, T \rightarrow \infty \tag{B.4}
\end{equation*}
$$

and $c(T)=\left(3 b_{0}(a(T))\right)^{\frac{1}{2}}$.

If $b_{0}(a)=0$ for some $a>a(0)\left(a_{T}^{\prime}=2 b_{0}>0\right)$, then we denote $a_{1}$, the smallest such $a$ and assume that the order of vanishing of $b_{0}$ there is $\ell_{1}$. The analysis of (B.3) shows that

$$
a(T)=a_{1}+\mathcal{O}(1) \begin{cases}K e^{-\gamma T} & \ell_{1}=1 \\ K T^{-1 /\left(\ell_{1}-1\right)} & \ell_{1}>1\end{cases}
$$

which gives the rate of decay of $c(T)$.
Hence we have shown the following statement which is almost as long to state as to prove:

Lemma B.1. Suppose that in (B.1) $b_{0}=b_{0}(a)$. Then

$$
E \neq 0, \quad|c(0)|>\delta_{0}>0 \Longrightarrow \exists \delta>0 \forall T>0, \quad|c(T)|>\delta
$$

If $E=0$, let

$$
a_{1}=\min \left\{a: a>a(0), b_{0}(a)=0\right\}
$$

with $a_{1}$ not defined if the set is empty (note that $c(0) \neq 0$ and $E=0$ imply that $\left.b_{0}(a(0))>0\right)$. Now suppose that $a_{1}$ exists, and that

$$
\partial^{\ell} b_{0}\left(a_{1}\right)=0, \quad \ell<\ell_{1}, \quad \partial^{\ell_{1}} b_{0}\left(a_{1}\right) \neq 0
$$

Then as $T \rightarrow \infty$,

$$
|c(T)| \leq \begin{cases}K e^{-\gamma T} & \ell_{1}=1 \\ K T^{-\ell_{1} /\left(\ell_{1}-1\right)} & \ell_{1}>1\end{cases}
$$

for some constants $\gamma$ and $K$, and $a(T) \rightarrow a_{1}$.
If $a_{1}$ does not exist then $c(T)=\left(3 b_{0}(a(T))\right)^{\frac{1}{2}}, a(T) \rightarrow \infty, T \rightarrow \infty$.
We excluded the case of infinite order of vanishing since it is very special from our point of view.

The lemma suggests that $c \rightarrow 0$ is highly nongeneric but it can occur for our system. Since for the original time $t$ in (1.1) we would like to go up to time $\delta \log (1 / h) / h$ we cannot do it in some cases as then

$$
\left.c(t)\right|_{t=\delta \log (1 / h) / h} \sim \begin{cases}h^{\gamma \delta / 2} & \ell_{1}=1 \\ \log ^{-\frac{1}{2} \ell_{1} /\left(\ell_{1}-1\right)}(1 / h) & \ell_{1}>1\end{cases}
$$

B.3. Avoided crossing for the effective equations of motion. Here we make some comments about the puzzling avoided crossing which needs further investigation.

For the decoupled equations it is easy to find examples in which

$$
\begin{equation*}
c_{1}\left(T_{0}\right)=c_{2}\left(T_{0}\right) \tag{B.5}
\end{equation*}
$$

One is shown in Fig.6. We take $b_{0}$ independent of $T$ and equal to $\cos ^{2} x$. If we choose the initial conditions so that $c_{j}^{2}=3 \cos ^{2} A_{j}, A_{j}=h a_{j}$ as in (1.11), and

Figure 6. The plots of $\left(A_{j}, c_{j}\right), j=1,2$, solving (B.6) for for $b_{0}(x, t)=\cos ^{2} x$ and initial data $A_{1}(0)=-\pi / 3, A_{2}(0)=\pi / 6$, and $c_{1}(0)=\sqrt{3} \cos (\pi / 3), c_{2}(0)=\sqrt{3} \cos (\pi / 6)$. The "decoupled" curve corresponds to solving (1.11). Because of the choice of initial conditions, $\left(A_{j}, c_{j}\right), j=1,2$ line on the same curve.
$-\pi / 2<A_{1}<-A_{2}<0$, then when $A_{1}\left(T_{0}\right)=-A_{2}\left(T_{0}\right)$ we have (B.5) (this also provides an example of $c_{2}(T) \rightarrow 0$ as $\left.T \rightarrow \infty\right)$.

The decoupled equations (1.11) should be compared the rescaled version of (1.4):

$$
\begin{gather*}
\partial_{T} c_{j}=\partial_{x_{j}} B_{0}(c, A, h), \quad \partial_{T} A_{j}=c_{j}^{2}-\partial_{c_{j}} B_{0}(c, A, h), \\
B_{0}(c, A, h) \stackrel{\text { def }}{=} \frac{1}{2} \int q_{2}(x / h, c, A / h) b_{0}(x) d x . \tag{B.6}
\end{gather*}
$$

For the example above the comparison between the solutions of the decoupled $h$ independent equations and solutions to the equation (B.6) are shown in Fig.6 (the solutions (1.11) are shown as a single curve which both solutions with these initial data follow).

Figure 7. The plots of $q_{2}(x, c, A / h)$ for $\left(A_{j}, c_{j}\right), j=1,2$, solving (B.6) for for $b_{0}(x, t)=\cos ^{2} x$ and initial data $A_{1}(0)=-\pi / 3, A_{2}(0)=\pi / 6$, and $c_{1}(0)=\sqrt{3} \cos (\pi / 3), c_{2}(0)=\sqrt{3} \cos (\pi / 6)$. On the left $h=0.1$ and on the right $h=0.3$.

The dramatic avoided crossings shown in Fig. 6 (and also, for a different, time dependent $b_{0}$ in Fig.3) are not seen in the behaviour of $q_{2}(x, c, A / h)$ which is the approximation of the solution to (1.1) - see Fig.7. The masses of the right and left solitons are switched and that corresponds to the switch of positions of $A_{1}$ and $A_{2}$. It is possible that a different parametrization of double solitons would resolve this problem. Another possibility is to study the decomposition (3.11) in the proof of Lemma 3.2 uniformly $\alpha \rightarrow 0$ (corresponding to $a_{2}-a_{1} \rightarrow 0$ ).

We conclude with two heuristic observations. If the decoupled equations lead to (B.5) and $\left|A_{1}-A_{2}\right|>\epsilon>0$ (which is the case when we approach the crossing in Fig.6) then equations (B.6) differ from (1.11) by terms of size

$$
h \log \left(\frac{c_{2}-c_{1}}{c_{1}+c_{2}}\right),
$$

see Lemma 3.2. For this to affect the motion of trajectories on finite time scales in $T$ we need

$$
\begin{equation*}
c_{2}-c_{1} \simeq \exp \left(-\frac{\gamma}{h}\right) . \tag{B.7}
\end{equation*}
$$

This means that $c_{j}$ 's have to get exponentially close to each other (but does not explain avoided crossing).

On the other hand if $\left|a_{1}-a_{2}\right|>\epsilon>0$, where $a_{j}$ 's are the original variables in (1.4), $A_{j}(0)=h a_{j}(0)$, then we can use the decomposition in Lemma 3.2 and variables $\hat{a}_{j}$ defined by (3.7). The remark after the proof of Lemma 3.6 shows that the equations of motion take essentially the same form written in terms of $\widehat{a}_{j}$ 's and $c_{j}$ 's and hence $\hat{a}_{j}$ has to stay bounded. And that means that $c_{2}-c_{1}$ is bounded away from 0 . Hence, when $c_{2}-c_{1} \rightarrow 0$ we must also have $a_{2}-a_{1} \rightarrow 0$ as seen in Fig. 3 and Fig.6.

Appendix C. Alternative proof of Lemma 4.7 (with Bernd Sturmfels)
We note that the standard substition reduces the equation $P(c) u=0$, where $P(c)$ is defined in (4.20), to an equation with rational coefficients:

$$
z=\tanh x, \quad \partial_{x}=\left(1-z^{2}\right) \partial_{z}, \quad \eta^{2}=1-z^{2} .
$$

This means that $P(c) u=0$ is equivalent to $Q(c) v=0, u(x)=v(\tanh x)$, where

$$
Q(c)=\left(L^{2}+1\right)\left(L^{2}+c^{2}\right)-10 L R(z) L+10\left(3 R(z)-2 R(z)^{2}\right)-6\left(1+c^{2}\right) R(z),
$$

and

$$
L=\frac{1}{i}\left(1-z^{2}\right) \partial_{z}, \quad R(z)=1-z^{2}, \quad-1<z<1
$$

Lemma 4.7 will follow from finding a basis of solutions of $Q(c) v=0$ and from seeing that the only bounded solution is the one corresponding to $\partial_{x} \eta$, that is, to

$$
v(z)=z\left(1-z^{2}\right)^{\frac{1}{2}}
$$

Remarkably, and no doubt because of some deeper underlying structure due to complete integrability, this can be achieved using MAPLE package DEtools.

First, the operator $Q(c)$ is brought to a convenient form

$$
\begin{aligned}
Q= & (z-1)^{4}(z+1)^{4} \frac{d^{4}}{d z^{4}} f(z)+12 z(z-1)^{3}(z+1)^{3} \frac{d^{3}}{d z^{3}} f(z) \\
& +(z-1)^{2}(z+1)^{2}\left(26 z^{2}-c^{2}+1\right) \frac{d^{2}}{d z^{2}} f(z) \\
& -2 z(z-1)(z+1)\left(8 z^{2}-11+c^{2}\right) \frac{d}{d z} f(z) \\
& +\left(4-20 z^{2}+6 c^{2} z^{2}-5 c^{2}+16 z^{2}\right) f(z)
\end{aligned}
$$

Applying the MAPLE command DFactorsols $(\mathbb{Q}, f(z))$ gives the following explicit basis of solutions to $Q(c) v=0, c \neq 1$ :

$$
\begin{aligned}
v_{1}(z)= & \left(1-z^{2}\right)^{\frac{1}{2}} z, \\
v_{2}(z)= & (1+z)^{-\frac{c}{2}}(1-z)^{\frac{c}{2}}\left((c+z)^{2}+z^{2}-1\right), \\
v_{3}(z)= & v_{2}(-z)=(1+z)^{\frac{c}{2}}(z-1)^{-\frac{c}{2}}\left((c-z)^{2}+z^{2}-1\right), \\
v_{4}(z)= & \left(1-z^{2}\right)^{-\frac{1}{2}}\left(-3 z c^{2}+3 z^{3} c^{2}-7 z^{3}+7 z\right) \log \frac{z+1}{z-1} \\
& +\left(1-z^{2}\right)^{-\frac{1}{2}}\left(4 c^{2}-6 c^{2} z^{2}+14 z^{2}-12\right) .
\end{aligned}
$$

For $c \neq 1$ these solutions are linearly independent and only $v_{1}$ vanishes at $z= \pm 1$ (or is bounded). Hence $\operatorname{ker}_{L^{2}} P(c)$ is one dimensional proving Lemma 4.7.

[^0]:    ${ }^{\dagger}$ A compensation for that comes however at having the semiclassical propagation accurate for larger values of $h$.

[^1]:    ${ }^{\ddagger}$ It is further assumed in [11] that $\|b\|_{L_{T}^{\infty} L_{x}^{\infty}}$ is small, although this appears to be unnecessary in their argument.
